Samples: TMS320F2809, TMS320F2808, TMS320F2806, TMS320F2802, TMS320F2801, TMS320C2802, TMS320C2801, TMS320F28016, TMS320F28015

#### 1 F280x, F2801x, C280x DSPs

1.1 **Features** 

www.ti.com

- High-Performance Static CMOS Technology - 100 MHz (10-ns Cycle Time)
  - 60 MHz (16.67-ns Cycle Time)
  - Low-Power (1.8-V Core, 3.3-V I/O) Design
- JTAG Boundary Scan Support <sup>(1)</sup>
- High-Performance 32-Bit CPU (TMS320C28x<sup>™</sup>) •
  - 16 x 16 and 32 x 32 MAC Operations
  - 16 x 16 Dual MAC
  - Harvard Bus Architecture
  - Atomic Operations
  - Fast Interrupt Response and Processing
  - Unified Memory Programming Model
  - Code-Efficient (in C/C++ and Assembly)
- On-Chip Memory
  - F2809: 128K x 16 Flash, 18K x 16 SARAM F2808: 64K x 16 Flash, 18K x 16 SARAM F2806: 32K x 16 Flash, 10K x 16 SARAM F2802: 32K x 16 Flash, 6K x 16 SARAM F2801: 16K x 16 Flash, 6K x 16 SARAM F2801x: 16K x 16 Flash, 6K x 16 SARAM
  - 1K x 16 OTP ROM (Flash Devices Only)
  - C2802: 32K x 16 ROM, 6K x 16 SARAM C2801: 16K x 16 ROM, 6K x 16 SARAM
- Boot ROM (4K x 16)
  - With Software Boot Modes (via SCI, SPI, CAN, I2C, and Parallel I/O)
  - Standard Math Tables
- Clock and System Control
  - Dynamic PLL Ratio Changes Supported
  - On-Chip Oscillator

**Boundary Scan Architecture** 

- Watchdog Timer Module
- Any GPIO A Pin Can Be Connected to One of the Three External Core Interrupts
- Peripheral Interrupt Expansion (PIE) Block That Supports All 43 Peripheral Interrupts

- 128-Bit Security Key/Lock
  - Protects Flash/OTP/L0/L1 Blocks
  - Prevents Firmware Reverse Engineering
- Three 32-Bit CPU Timers
- **Enhanced Control Peripherals** 
  - Up to 16 PWM Outputs
  - Up to 6 HRPWM Outputs With 150-ps MEP Resolution
  - Up to Four Capture Inputs
  - Up to Two Quadrature Encoder Interfaces
  - Up to Six 32-bit/Six 16-bit Timers
- Serial Port Peripherals
  - Up to 4 SPI Modules
  - Up to 2 SCI (UART) Modules
  - Up to 2 CAN Modules
  - One Inter-Integrated-Circuit (I2C) Bus
- 12-Bit ADC, 16 Channels
  - 2 x 8 Channel Input Multiplexer
  - Two Sample-and-Hold
  - Single/Simultaneous Conversions
  - Fast Conversion Rate: 80 ns - 12.5 MSPS (F2809 only) 160 ns - 6.25 MSPS (280x) 267 ns - 3.75 MSPS (F2801x)
  - Internal or External Reference
- Up to 35 Individually Programmable, Multiplexed GPIO Pins With Input Filtering
- Advanced Emulation Features
  - Analysis and Breakpoint Functions
  - Real-Time Debug via Hardware
- Development Support Includes
  - ANSI C/C++ Compiler/Assembler/Linker
  - Code Composer Studio<sup>™</sup> IDE
  - DSP/BIOS™
  - Digital Motor Control and Digital Power Software Libraries
- Low-Power Modes and Power Savings - IDLE, STANDBY, HALT Modes Supported
  - Disable Individual Peripheral Clocks

#### Package Options

- Thin Quad Flatpack (PZ)
- MicroStar BGA<sup>™</sup> (GGM, ZGM)

- Temperature Options
  - A: –40°C to 85°C (PZ, GGM, ZGM)
  - S: -40°C to 125°C (PZ, GGM, ZGM)
  - Q: -40°C to 125°C (PZ)

#### 1.2 Getting Started

This section gives a brief overview of the steps to take when first developing for a C28x<sup>™</sup> device. For more detail on each of these steps, see the following:

- Getting Started With TMS320C28x Digital Signal Controllers (literature number SPRAAM0).
- C2000 Getting Started Website (http://www.ti.com/c2000getstarted)

#### Step 1. Acquire the appropriate development tools

The quickest way to begin working with a C28x device is to acquire an eZdsp<sup>™</sup> kit for initial development, which, in one package, includes:

- On-board JTAG emulation via USB or parallel port
- Appropriate emulation driver
- Code Composer Studio<sup>™</sup> IDE for eZdsp

Once you have become familiar with the device and begin developing on your own hardware, purchase Code Composer Studio<sup>™</sup> IDE separately for software development and a JTAG emulation tool to get started on your project.

#### Step 2. Download starter software

To simplify programming for C28x devices, it is recommended that users download and use the C/C++ Header Files and Example(s) to begin developing software for the C28x devices and their various peripherals.

After downloading the appropriate header file package for your device, refer to the following resources for step-by-step instructions on how to run the peripheral examples and use the header file structure for your own software

- The Quick Start Readme in the /doc directory to run your first application.
- Programming TMS320x28xx and 28xxx Peripherals in C/C++ Application Report (literature number SPRAA85)

#### Step 3. Download flash programming software

Many C28x devices include on-chip flash memory and tools that allow you to program the flash with your software IP.

- Flash Tools: C28x Flash Tools
- TMS320F281x<sup>™</sup> Flash Programming Solutions (literature number SPRB169)
- Running an Application from Internal Flash Memory on the TMS320F28xxx DSP (literature number <u>SPRA958</u>)

#### Step 4. Move on to more advanced topics

For more application software and other advanced topics, visit the TI<sup>™</sup> website at http://www.ti.com/c2000getstarted.

#### 2 Introduction

The TMS320F2809, TMS320F2808, TMS320F2806, TMS320F2802, TMS320F2801, TMS320F28015, TMS320F28016, TMS320C2802, and TMS320C2801 devices, members of the TMS320C28x<sup>™</sup> DSP generation, are highly integrated, high-performance solutions for demanding control applications.

Throughout this document, TMS320F2809, TMS320F2808, TMS320F2806, TMS320F2802, TMS320F2801, TMS320C2802, TMS320C2801, TMS320F28015, and TMS320F28016 are abbreviated as F2809, F2808, F2806, F2802, F2801, C2802, C2801, F28015, and F28016, respectively. TMS320F28015 and TMS320F28016 are abbreviated as F2801x. Table 2-1 provides a summary of features for each device.

(1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the *TMS320x28xx*, *28xxx DSP Peripheral Reference Guide* (literature number <u>SPRU566</u>) and in the peripheral reference guides.

(2) See Section 5.1, Device and Development Support Tool Nomenclature, for descriptions of device stages.

(1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the *TMS320x28xx, 28xxx DSP Peripheral Reference Guide* (literature number <u>SPRU566</u>) and in the peripheral reference guides.

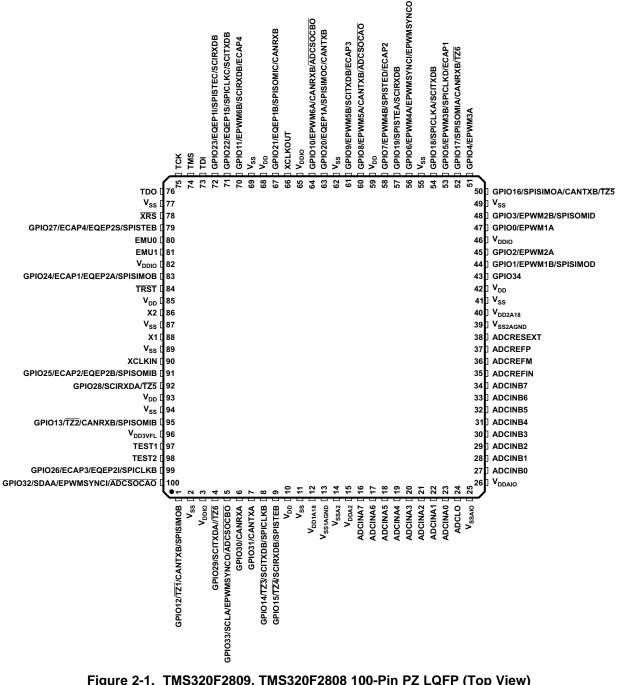

(2) See Section 5.1, Device and Development Support Tool Nomenclature, for descriptions of device stages.

#### 2.1 **Pin Assignments**

The TMS320F2809, TMS320F2808, TMS320F2806, TMS320F2802, TMS320F2801, TMS320C2802, TMS320C2801, TMS320F28015, and TMS320F28016 100-pin PZ low-profile quad flatpack (LQFP) pin assignments are shown in Figure 2-1, Figure 2-2, Figure 2-3, and Figure 2-4. The 100-ball GGM and ZGM ball grid array (BGA) terminal assignments are shown in Figure 2-5. Table 2-3 describes the function(s) of each pin.

#### 2.2 Signal Descriptions

Table 2-3 describes the signals on the 280x devices. All digital inputs are TTL-compatible. All outputs are 3.3 V with CMOS levels. Inputs are not 5-V tolerant.

#### **Table 2-3. Signal Descriptions**

|                     | PIN                     | NO. |   |  |  |  |  |  |
|---------------------|-------------------------|-----|---|--|--|--|--|--|
| NAME                | PZ GGM/<br>PIN # BALL # |     | DESCRIPTION <sup>(1)</sup>  |  |  |  |  |  |
|                     |                         |     | JTAG  |  |  |  |  |  |
| TRST                | 84                      | A6  | JTAG test reset with internal pulldown. TRST, when driven high, gives the scan system control of the operations of the device. If this signal is not connected or driven low, the device operates in its functional mode, and the test reset signals are ignored.<br><b>NOTE:</b> Do not use pullup resistors on TRST; it has an internal pull-down device. TRST is an active high test pin and must be maintained low at all times during normal device operation. An external pulldown resistor is required on this pin. The value of this resistor should be based on drive strength of the debugger pods applicable to the design. A 2.2-k $\Omega$ resistor generally offers adequate protection. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application. (I, $\downarrow$ ) |  |  |  |  |  |
| ТСК                 | 75                      | A10 | JTAG test clock with internal pullup (I, ↑)   |  |  |  |  |  |
| TMS                 | 74                      | B10 | JTAG test-mode select (TMS) with internal pullup. This serial control input is clocked into the TAP controller on the rising edge of TCK. (I, $\uparrow$ )  |  |  |  |  |  |
| TDI                 | 73                      | C9  | JTAG test data input (TDI) with internal pullup. TDI is clocked into the selected register (instruction or data) on a rising edge of TCK. (I, $\uparrow$ )  |  |  |  |  |  |
| TDO                 | 76                      | B9  | JTAG scan out, test data output (TDO). The contents of the selected register (instruction or data) are shifted out of TDO on the falling edge of TCK. (O/Z 8 mA drive)  |  |  |  |  |  |
| EMU0                | 80                      | A8  | Emulator pin 0. When $\overline{\text{TRST}}$ is driven high, this pin is used as an interrupt to or from the emulator system and is defined as input/output through the JTAG scan. This pin is also used to put the device into boundary-scan mode. With the EMU0 pin at a logic-high state and the EMU1 pin at a logic-low state, a rising edge on the TRST pin would latch the device into boundary-scan mode. (I/O/Z, 8 mA drive $\uparrow$ )<br><b>NOTE:</b> An external pullup resistor is recommended on this pin. The value of this resistor should be based on the drive strength of the debugger pods applicable to the design. A 2.2-k $\Omega$ to 4.7-k $\Omega$ resistor is generally adequate. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application.              |  |  |  |  |  |
| EMU1                | 81                      | В7  | Emulator pin 1. When TRST is driven high, this pin is used as an interrupt to or from the emulator system and is defined as input/output through the JTAG scan. This pin is also used to put the device into boundary-scan mode. With the EMU0 pin at a logic-high state and the EMU1 pin at a logic-low state, a rising edge on the TRST pin would latch the device into boundary-scan mode. (I/O/Z, 8 mA drive $\uparrow$ )<br><b>NOTE:</b> An external pullup resistor is recommended on this pin. The value of this resistor should be based on the drive strength of the debugger pods applicable to the design. A 2.2-k $\Omega$ to 4.7-k $\Omega$ resistor is generally adequate. Since this is application-specific, it is recommended that each target board be validated for proper operation of the debugger and the application.                                  |  |  |  |  |  |
|                     |                         | T   | FLASH   |  |  |  |  |  |
| V <sub>DD3VFL</sub> | 96                      | C4  | 3.3-V Flash Core Power Pin. This pin should be connected to 3.3 V at all times. On the ROM parts (C280x), this pin should be connected to $V_{\text{DDIO}}$ .   |  |  |  |  |  |
| TEST1               | 97                      | A3  | Test Pin. Reserved for TI. Must be left unconnected. (I/O)  |  |  |  |  |  |
| TEST2               | 98                      | B3  | Test Pin. Reserved for TI. Must be left unconnected. (I/O)  |  |  |  |  |  |
|                     | 1                       | 1   | CLOCK   |  |  |  |  |  |
| XCLKOUT             | 66                      | E8  | Output clock derived from SYSCLKOUT. XCLKOUT is either the same frequency, one-half the frequency, or one-fourth the frequency of SYSCLKOUT. This is controlled by the bits 1, 0 (XCLKOUTDIV) in the XCLK register. At reset, XCLKOUT = SYSCLKOUT/4. The XCLKOUT signal can be turned off by setting XCLKOUTDIV to 3. Unlike other GPIO pins, the XCLKOUT pin is not placed in high-impedance state during a reset. (O/Z, 8 mA drive).  |  |  |  |  |  |
| XCLKIN              | 90                      | B5  | External Oscillator Input. This pin is used to feed a clock from an external 3.3-V oscillator. In this case, tie the X1 pin to GND. Alternately, when a crystal/resonator is used (or if an external 1.8-V oscillator is fed into the X1 pin), tie the XCLKIN pin to GND. (I)   |  |  |  |  |  |

(1) I = Input, O = Output, Z = High impedance, OD = Open drain,  $\uparrow$  = Pullup,  $\downarrow$  = Pulldown

|           | PIN         | NO.                   | DESCRIPTION <sup>(1)</sup>  |  |  |
|-----------|-------------|-----------------------|---|--|--|
| NAME      | PZ<br>PIN # | GGM/<br>ZGM<br>BALL # |   |  |  |
| X1        | 88          | E6                    | Internal/External Oscillator Input. To use the internal oscillator, a quartz crystal or a ceramic resonator may be connected across X1 and X2. The X1 pin is referenced to the 1.8-V core digital power supply. A 1.8-V external oscillator may be connected to the X1 pin. In this case, the XCLKIN pin must be connected to ground. If a 3.3-V external oscillator is used with the XCLKIN pin, X1 must be tied to GND. (I)   |  |  |
| X2        | 86          | C6                    | Internal Oscillator Output. A quartz crystal or a ceramic resonator may be connected across X1 and X2. If X2 is not used it must be left unconnected. (O)   |  |  |
|           |             |                       | RESET   |  |  |
| XRS       | 78          | B8                    | Device Reset (in) and Watchdog Reset (out).<br>Device reset. XRS causes the device to terminate execution. The PC will point to the address<br>contained at the location 0x3FFFC0. When XRS is brought to a high level, execution begins at the<br>location pointed to by the PC. This pin is driven low by the DSP when a watchdog reset occurs.<br>During watchdog reset, the XRS pin is driven low for the watchdog reset duration of 512 OSCCLK<br>cycles. (I/OD, ↑)<br>The output buffer of this pin is an open-drain with an internal pullup. It is recommended that this pin<br>be driven by an open-drain device. |  |  |

#### Table 2-3. Signal Descriptions (continued)

(1) Some peripheral functions may not be available in TMS320F2801x devices. See Table 2-2 for details.

(2) All GPIO pins are I/O/Z, 4-mA drive typical (unless otherwise indicated), and have an internal pullup, which can be selectively

enabled/disabled on a per-pin basis. This feature only applies to the GPIO pins. The GPIO function (shown in Italics) is the default at reset. The peripheral signals that are listed under them are alternate functions.

(3) The pullups on GPIO0-GPIO11 pins are not enabled at reset.

| 0x3F 7FF8 – 0x3F 7FFF | Security Password (128-Bit)<br>(Do not program to all zeros)   |

#### NOTE

- When the code-security passwords are programmed, all addresses between 0x3F7F80 and 0x3F7FF5 cannot be used as program code or data. These locations must be programmed to 0x0000.
- If the code security feature is not used, addresses 0x3F7F80 through 0x3F7FEF may be used for code or data. Addresses 0x3F7FF0 – 0x3F7FF5 are reserved for data and should not contain program code.
- On ROM devices, addresses 0x3F7FF0 0x3F7FF5 and 0x3D7BFC 0x3D7BFF are
  reserved for TI, irrespective of whether code security has been used or not. User
  application should not use these locations in any way.

Table 3-5 shows how to handle these memory locations.

#### Table 3-5. Impact of Using the Code Security Module

| ADDRESS               | FLASH                 |                           | ROM                          |                           |
|-----------------------|-----------------------|---------------------------|------------------------------|---------------------------|
| ADDRE55               | Code security enabled | Code security disabled    | Code security enabled        | Code security disabled    |
| 0x3F 7F80 – 0x3F 7FEF |                       | Application code and data | Fill with 0x0000             | Application code and data |
| 0x3F 7FF0 – 0x3F 7FF5 | Fill with 0x0000      | Reserved for data only    | Reserved for TI. Do not use. |                           |
| 0x3D 7BFC – 0x3D 7BFF | Application c         | ode and data              | Reserved for                 | II. Do not use.           |

Peripheral Frame 1 and Peripheral Frame 2 are grouped together so as to enable these blocks to be write/read peripheral block protected. The protected mode ensures that all accesses to these blocks happen as written. Because of the C28x pipeline, a write immediately followed by a read, to different memory locations, will appear in reverse order on the memory bus of the CPU. This can cause problems in certain peripheral applications where the user expected the write to occur first (as written). The C28x CPU supports a block protection mode where a region of memory can be protected so as to make sure that operations occur as written (the penalty is extra cycles are added to align the operations). This mode is programmable and by default, it will protect the selected zones.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

#### TEXAS INSTRUMENTS

www.ti.com

#### 3.2 Brief Descriptions

#### 3.2.1 C28x CPU

The C28x<sup>™</sup> DSP generation is the newest member of the TMS320C2000<sup>™</sup> DSP platform. The C28x is a very efficient C/C++ engine, enabling users to develop not only their system control software in a high-level language, but also enables math algorithms to be developed using C/C++. The C28x is as efficient in DSP math tasks as it is in system control tasks that typically are handled by microcontroller devices. This efficiency removes the need for a second processor in many systems. The 32 x 32-bit MAC capabilities of the C28x and its 64-bit processing capabilities, enable the C28x to efficiently handle higher numerical resolution problems that would otherwise demand a more expensive floating-point processor solution. Add to this the fast interrupt response with automatic context save of critical registers, resulting in a device that is capable of servicing many asynchronous events with minimal latency. The C28x has an 8-level-deep protected pipeline with pipelined memory accesses. This pipelining enables the C28x to execute at high speeds without resorting to expensive high-speed memories. Special branch-look-ahead hardware minimizes the latency for conditional discontinuities. Special store conditional operations further improve performance.

#### 3.2.2 Memory Bus (Harvard Bus Architecture)

As with many DSP type devices, multiple busses are used to move data between the memories and peripherals and the CPU. The C28x memory bus architecture contains a program read bus, data read bus and data write bus. The program read bus consists of 22 address lines and 32 data lines. The data read and write busses consist of 32 address lines and 32 data lines each. The 32-bit-wide data busses enable single cycle 32-bit operations. The multiple bus architecture, commonly termed Harvard Bus, enables the C28x to fetch an instruction, read a data value and write a data value in a single cycle. All peripherals and memories attached to the memory bus will prioritize memory accesses. Generally, the priority of memory bus accesses can be summarized as follows:

| Highest: | Data Writes      | (Simultaneous data and program writes cannot occur on the memory bus.)   |
|----------|------------------|--|
|          | Program Writes   | (Simultaneous data and program writes cannot occur on the memory bus.)   |
|          | Data Reads       |  |
|          | Program<br>Reads | (Simultaneous program reads and fetches cannot occur on the memory bus.) |
| Lowest:  | Fetches          | (Simultaneous program reads and fetches cannot occur on the memory bus.) |

#### 3.2.3 Peripheral Bus

To enable migration of peripherals between various Texas Instruments (TI) DSP family of devices, the 280x devices adopt a peripheral bus standard for peripheral interconnect. The peripheral bus bridge multiplexes the various busses that make up the processor Memory Bus into a single bus consisting of 16 address lines and 16 or 32 data lines and associated control signals. Two versions of the peripheral bus are supported on the 280x. One version only supports 16-bit accesses (called peripheral frame 2). The other version supports both 16- and 32-bit accesses (called peripheral frame 1).

34 Functional Overview

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

#### 3.2.4 Real-Time JTAG and Analysis

The 280x implements the standard IEEE 1149.1 JTAG interface. Additionally, the 280x supports real-time mode of operation whereby the contents of memory, peripheral and register locations can be modified while the processor is running and executing code and servicing interrupts. The user can also single step through non-time critical code while enabling time-critical interrupts to be serviced without interference. The 280x implements the real-time mode in hardware within the CPU. This is a unique feature to the 280x, no software monitor is required. Additionally, special analysis hardware is provided which allows the user to set hardware breakpoint or data/address watch-points and generate various user-selectable break events when a match occurs.

#### 3.2.5 Flash

The F2809 contains 128K x 16 of embedded flash memory, segregated into eight 16K x 16 sectors. The F2808 contains 64K x 16 of embedded flash memory, segregated into four 16K x 16 sectors. The F2806 and F2802 have 32K x 16 of embedded flash, segregated into four 8K x 16 sectors. The F2801 device contains 16K x 16 of embedded flash, segregated into four 4K x 16 sectors. All five devices also contain a single 1K x 16 of OTP memory at address range 0x3D 7800 – 0x3D 7BFF. The user can individually erase, program, and validate a flash sector while leaving other sectors untouched. However, it is not possible to use one sector of the flash or the OTP to execute flash algorithms that erase/program other sectors. Special memory pipelining is provided to enable the flash module to achieve higher performance. The flash/OTP is mapped to both program and data space; therefore, it can be used to execute code or store data information. Note that addresses 0x3F7FF0 - 0x3F7FF5 are reserved for data variables and should not contain program code.

#### NOTE

The F2809/F2808/F2806/F2802/F2801 Flash and OTP wait-states can be configured by the application. This allows applications running at slower frequencies to configure the flash to use fewer wait-states.

Flash effective performance can be improved by enabling the flash pipeline mode in the Flash options register. With this mode enabled, effective performance of linear code execution will be much faster than the raw performance indicated by the wait-state configuration alone. The exact performance gain when using the Flash pipeline mode is application-dependent.

For more information on the Flash options, Flash wait-state, and OTP wait-state registers, see the *TMS320x280x, 2801x, 2804x DSP System Control and Interrupts Reference Guide* (literature number <u>SPRU712</u>).

#### 3.2.6 ROM

The C2802 contains 32K x 16 of ROM, while the C2801 contains 16K x 16 of ROM.

#### 3.2.7 M0, M1 SARAMs

All 280x devices contain these two blocks of single-access memory, each 1K x 16 in size. The stack pointer points to the beginning of block M1 on reset. The M0 and M1 blocks, like all other memory blocks on C28x devices, are mapped to both program and data space. Hence, the user can use M0 and M1 to execute code or for data variables. The partitioning is performed within the linker. The C28x device presents a unified memory map to the programmer. This makes for easier programming in high-level languages.

Copyright © 2003–2011, Texas Instruments Incorporated

TEXAS INSTRUMENTS

www.ti.com

#### 3.2.8 LO, L1, H0 SARAMs

The F2809 and F2808 each contain an additional 16K x 16 of single-access RAM, divided into three blocks (L0-4K, L1-4K, H0-8K). The F2806 contains an additional 8K x 16 of single-access RAM, divided into two blocks (L0-4K, L1-4K). The F2802, F2801, C2802, and C2801 each contain an additional 4K x 16 of single-access RAM (L0-4K). Each block can be independently accessed to minimize CPU pipeline stalls. Each block is mapped to both program and data space.

#### 3.2.9 Boot ROM

The Boot ROM is factory-programmed with boot-loading software. Boot-mode signals are provided to tell the bootloader software what boot mode to use on power up. The user can select to boot normally or to download new software from an external connection or to select boot software that is programmed in the internal Flash/ROM. The Boot ROM also contains standard tables, such as SIN/COS waveforms, for use in math related algorithms.

| MODE              | DESCRIPTION  | GPIO18<br>SPICLKA<br>SCITXDB | GPIO29<br>SCITXDA | GPIO34 |
|-------------------|--|------------------------------|-------------------|--------|
| Boot to Flash/ROM | Jump to Flash/ROM address 0x3F 7FF6<br>You must have programmed a branch instruction here prior<br>to reset to redirect code execution as desired. | 1                            | 1                 | 1      |
| SCI-A Boot        | Load a data stream from SCI-A  | 1                            | 1                 | 0      |
| SPI-A Boot        | Load from an external serial SPI EEPROM on SPI-A   | 1                            | 0                 | 1      |
| I2C Boot          | Load data from an external EEPROM at address 0x50 on the I2C bus   | 1                            | 0                 | 0      |
| eCAN-A Boot       | Call CAN_Boot to load from eCAN-A mailbox 1.   | 0                            | 1                 | 1      |
| Boot to M0 SARAM  | Jump to M0 SARAM address 0x00 0000.  | 0                            | 1                 | 0      |
| Boot to OTP       | Jump to OTP address 0x3D 7800  | 0                            | 0                 | 1      |
| Parallel I/O Boot | Load data from GPIO0 - GPIO15  | 0                            | 0                 | 0      |

#### Table 3-7. Boot Mode Selection

#### 3.2.10 Security

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

The 280x devices support high levels of security to protect the user firmware from being reverse engineered. The security features a 128-bit password (hardcoded for 16 wait-states), which the user programs into the flash. One code security module (CSM) is used to protect the flash/OTP and the L0/L1 SARAM blocks. The security feature prevents unauthorized users from examining the memory contents via the JTAG port, executing code from external memory or trying to boot-load some undesirable software that would export the secure memory contents. To enable access to the secure blocks, the user must write the correct 128-bit KEY value, which matches the value stored in the password locations within the Flash.

#### NOTE

The 128-bit password (at 0x3F7FF8 - 0x3F7FFF) must not be programmed to zeros. Doing so would permanently lock the device.

#### disclaimer

#### **Code Security Module Disclaimer**

THE CODE SECURITY MODULE (CSM) INCLUDED ON THIS DEVICE WAS DESIGNED TO PASSWORD PROTECT THE DATA STORED IN THE ASSOCIATED MEMORY (EITHER ROM OR FLASH) AND IS WARRANTED BY TEXAS INSTRUMENTS (TI), IN ACCORDANCE WITH ITS STANDARD TERMS AND CONDITIONS, TO CONFORM TO TI'S PUBLISHED SPECIFICATIONS FOR THE WARRANTY PERIOD APPLICABLE FOR THIS DEVICE.

TI DOES NOT, HOWEVER, WARRANT OR REPRESENT THAT THE CSM CANNOT BE COMPROMISED OR BREACHED OR THAT THE DATA STORED IN THE ASSOCIATED MEMORY CANNOT BE ACCESSED THROUGH OTHER MEANS. MOREOVER, EXCEPT AS SET FORTH ABOVE, TI MAKES NO WARRANTIES OR REPRESENTATIONS CONCERNING THE CSM OR OPERATION OF THIS DEVICE, INCLUDING ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

IN NO EVENT SHALL TI BE LIABLE FOR ANY CONSEQUENTIAL, SPECIAL, INDIRECT, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER CAUSED, ARISING IN ANY WAY OUT OF YOUR USE OF THE CSM OR THIS DEVICE, WHETHER OR NOT TI HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. EXCLUDED DAMAGES INCLUDE, BUT ARE NOT LIMITED TO LOSS OF DATA, LOSS OF GOODWILL, LOSS OF USE OR INTERRUPTION OF BUSINESS OR OTHER ECONOMIC LOSS.

### 3.2.11 Peripheral Interrupt Expansion (PIE) Block

The PIE block serves to multiplex numerous interrupt sources into a smaller set of interrupt inputs. The PIE block can support up to 96 peripheral interrupts. On the 280x, 43 of the possible 96 interrupts are used by peripherals. The 96 interrupts are grouped into blocks of 8 and each group is fed into 1 of 12 CPU interrupt lines (INT1 to INT12). Each of the 96 interrupts is supported by its own vector stored in a dedicated RAM block that can be overwritten by the user. The vector is automatically fetched by the CPU on servicing the interrupt. It takes 8 CPU clock cycles to fetch the vector and save critical CPU registers. Hence the CPU can quickly respond to interrupt events. Prioritization of interrupts is controlled in hardware and software. Each individual interrupt can be enabled/disabled within the PIE block.

### 3.2.12 External Interrupts (XINT1, XINT2, XNMI)

The 280x supports three masked external interrupts (XINT1, XINT2, XNMI). XNMI can be connected to the INT13 or NMI interrupt of the CPU. Each of the interrupts can be selected for negative, positive, or both negative and positive edge triggering and can also be enabled/disabled (including the XNMI). The masked interrupts also contain a 16-bit free running up counter, which is reset to zero when a valid interrupt edge is detected. This counter can be used to accurately time stamp the interrupt. Unlike the 281x devices, there are no dedicated pins for the external interrupts. Rather, any Port A GPIO pin can be configured to trigger any external interrupt.

#### 3.2.13 Oscillator and PLL

The 280x can be clocked by an external oscillator or by a crystal attached to the on-chip oscillator circuit. A PLL is provided supporting up to 10 input-clock-scaling ratios. The PLL ratios can be changed on-the-fly in software, enabling the user to scale back on operating frequency if lower power operation is desired. Refer to the Electrical Specification section for timing details. The PLL block can be set in bypass mode.

#### 3.2.14 Watchdog

The 280x devices contain a watchdog timer. The user software must regularly reset the watchdog counter within a certain time frame; otherwise, the watchdog will generate a reset to the processor. The watchdog can be disabled if necessary.

#### 3.2.15 Peripheral Clocking

The clocks to each individual peripheral can be enabled/disabled so as to reduce power consumption when a peripheral is not in use. Additionally, the system clock to the serial ports (except I2C and eCAN) and the ADC blocks can be scaled relative to the CPU clock. This enables the timing of peripherals to be decoupled from increasing CPU clock speeds.

#### 3.2.16 Low-Power Modes

The 280x devices are full static CMOS devices. Three low-power modes are provided:

- IDLE: Place CPU into low-power mode. Peripheral clocks may be turned off selectively and only those peripherals that need to function during IDLE are left operating. An enabled interrupt from an active peripheral or the watchdog timer will wake the processor from IDLE mode.
- STANDBY: Turns off clock to CPU and peripherals. This mode leaves the oscillator and PLL functional. An external interrupt event will wake the processor and the peripherals. Execution begins on the next valid cycle after detection of the interrupt event
- HALT: Turns off the internal oscillator. This mode basically shuts down the device and places it in the lowest possible power consumption mode. A reset or external signal can wake the device from this mode.

| ADC: ADC Result Registers (dual-mapped)   |
| 5 ( 11 )  |
| PF1: eCAN: eCAN Mailbox and Control Registers   |
|   |
| GPIO: GPIO MUX Configuration and Control Registers  |
| ePWM: Enhanced Pulse Width Modulator Module and Registers   |
| eCAP: Enhanced Capture Module and Registers   |
| eQEP: Enhanced Quadrature Encoder Pulse Module and Registers  |
| PF2: SYS: System Control Registers  |
| SCI: Serial Communications Interface (SCI) Control and RX/TX Registers  |
| SPI: Serial Port Interface (SPI) Control and RX/TX Registers  |
| ADC: ADC Status, Control, and Result Register   |
| I2C: Inter-Integrated Circuit Module and Registers  |

#### 3.2.18 General-Purpose Input/Output (GPIO) Multiplexer

Most of the peripheral signals are multiplexed with general-purpose input/output (GPIO) signals. This enables the user to use a pin as GPIO if the peripheral signal or function is not used. On reset, GPIO pins are configured as inputs. The user can individually program each pin for GPIO mode or peripheral signal mode. For specific inputs, the user can also select the number of input qualification cycles. This is to filter unwanted noise glitches. The GPIO signals can also be used to bring the device out of specific low-power modes.

#### 3.2.19 32-Bit CPU-Timers (0, 1, 2)

CPU-Timers 0, 1, and 2 are identical 32-bit timers with presettable periods and with 16-bit clock prescaling. The timers have a 32-bit count-down register, which generates an interrupt when the counter reaches zero. The counter is decremented at the CPU clock speed divided by the prescale value setting. When the counter reaches zero, it is automatically reloaded with a 32-bit period value. CPU-Timer 2 is reserved for the DSP/BIOS Real-Time OS, and is connected to INT14 of the CPU. If DSP/BIOS is not being used, CPU-Timer 2 is available for general use. CPU-Timer 1 is for general use and can be connected to INT13 of the CPU. CPU-Timer 0 is also for general use and is connected to the PIE block.

#### 3.2.20 Control Peripherals

The 280x devices support the following peripherals which are used for embedded control and communication:

- ePWM: The enhanced PWM peripheral supports independent/complementary PWM generation, adjustable dead-band generation for leading/trailing edges, latched/cycle-by-cycle trip mechanism. Some of the PWM pins support HRPWM features.
- eCAP: The enhanced capture peripheral uses a 32-bit time base and registers up to four programmable events in continuous/one-shot capture modes. This peripheral can also be configured to generate an auxiliary PWM signal.

Copyright © 2003–2011, Texas Instruments Incorporated

- eQEP: The enhanced QEP peripheral uses a 32-bit position counter, supports low-speed measurement using capture unit and high-speed measurement using a 32-bit unit timer. This peripheral has a watchdog timer to detect motor stall and input error detection logic to identify simultaneous edge transition in QEP signals.
- ADC: The ADC block is a 12-bit converter, single-ended, 16-channels. It contains two sample-and-hold units for simultaneous sampling.

#### 3.2.21 Serial Port Peripherals

The 280x devices support the following serial communication peripherals:

- eCAN: This is the enhanced version of the CAN peripheral. It supports 32 mailboxes, time stamping of messages, and is CAN 2.0B-compliant.
- SPI: The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the DSP controller and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multi-device communications are supported by the master/slave operation of the SPI. On the 280x, the SPI contains a 16-level receive and transmit FIFO for reducing interrupt servicing overhead.
- SCI: The serial communications interface is a two-wire asynchronous serial port, commonly known as UART. On the 280x, the SCI contains a 16-level receive and transmit FIFO for reducing interrupt servicing overhead.
- I2C: The inter-integrated circuit (I2C) module provides an interface between a DSP and other devices compliant with Philips Semiconductors Inter-IC bus (I2C-bus) specification version 2.1 and connected by way of an I2C-bus. External components attached to this 2-wire serial bus can transmit/receive up to 8-bit data to/from the DSP through the I2C module. On the 280x, the I2C contains a 16-level receive and transmit FIFO for reducing interrupt servicing overhead.

#### 3.3 Register Map

The 280x devices contain three peripheral register spaces. The spaces are categorized as follows:

| Peripheral<br>Frame 0: | These are peripherals that are mapped directly to the CPU memory bus. See Table 3-8. |
|------------------------|--|
| Peripheral<br>Frame 1  | These are peripherals that are mapped to the 32-bit peripheral bus. See Table 3-9.   |
| Peripheral<br>Frame 2: | These are peripherals that are mapped to the 16-bit peripheral bus. See Table 3-10.  |

| PIE Vector Table                   | 0x0D00 – 0x0DFF | 256        | EALLOW protected                  |

(1) Registers in Frame 0 support 16-bit and 32-bit accesses.

(2) Missing segments of memory space are reserved and should not be used in applications.

(3) If registers are EALLOW protected, then writes cannot be performed until the EALLOW instruction is executed. The EDIS instruction disables writes to prevent stray code or pointers from corrupting register contents.

(4) The Flash Registers are also protected by the Code Security Module (CSM).

#### Table 3-11. Device Emulation Registers

(1) The first byte (00) denotes flash devices. FF denotes ROM devices. Other values are reserved for future devices.

#### 3.5 Interrupts

Figure 3-7 shows how the various interrupt sources are multiplexed within the 280x devices.

Eight PIE block interrupts are grouped into one CPU interrupt. In total, 12 CPU interrupt groups, with 8 interrupts per group equals 96 possible interrupts. On the 280x, 43 of these are used by peripherals as shown in Table 3-12.

The TRAP #VectorNumber instruction transfers program control to the interrupt service routine corresponding to the vector specified. TRAP #0 attempts to transfer program control to the address pointed to by the reset vector. The PIE vector table does not, however, include a reset vector. Therefore, TRAP #0 should not be used when the PIE is enabled. Doing so will result in undefined behavior.

42 Functional Overview

# TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

When the PIE is enabled, TRAP #1 through TRAP #12 will transfer program control to the interrupt service routine corresponding to the first vector within the PIE group. For example: TRAP #1 fetches the vector from INT1.1, TRAP #2 fetches the vector from INT2.1 and so forth.

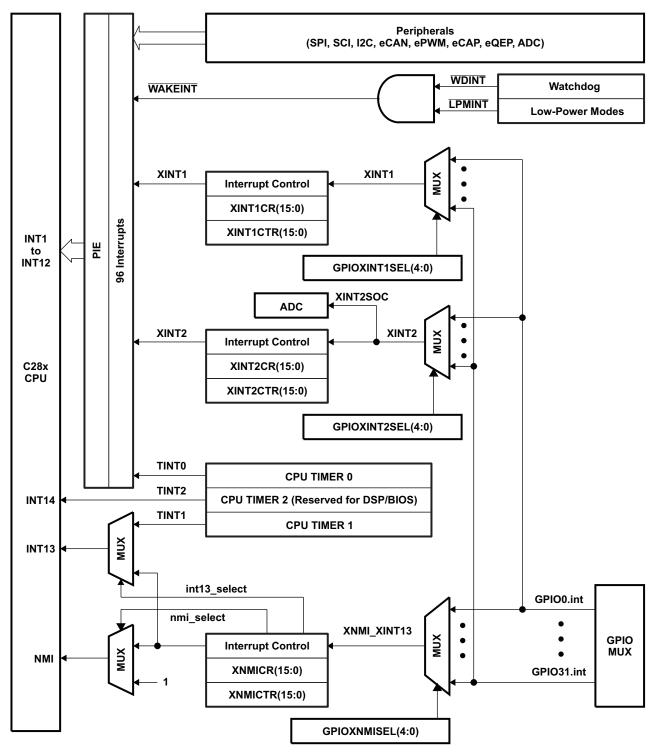

Figure 3-7. External and PIE Interrupt Sources

#### Table 3-12. PIE Peripheral Interrupts<sup>(1)</sup>

Out of the 96 possible interrupts, 43 interrupts are currently used. The remaining interrupts are reserved for future devices. These
interrupts can be used as software interrupts if they are enabled at the PIEIFRx level, provided none of the interrupts within the group is
being used by a peripheral. Otherwise, interrupts coming in from peripherals may be lost by accidentally clearing their flag while
modifying the PIEIFR. To summarize, there are two safe cases when the reserved interrupts could be used as software interrupts:

 No peripheral within the group is asserting interrupts.

2) No peripheral interrupts are assigned to the group (example PIE group 12).

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

Each external interrupt can be enabled/disabled or qualified using positive, negative, or both positive and negative edge. For more information, see the *TMS320x280x*, *2801x*, *2804x DSP System Control and Interrupts Reference Guide* (literature number SPRU712).

#### 3.6 System Control

This section describes the 280x oscillator, PLL and clocking mechanisms, the watchdog function and the low power modes. Figure 3-9 shows the various clock and reset domains in the 280x devices that will be discussed.

A. CLKIN is the clock into the CPU. It is passed out of the CPU as SYSCLKOUT (that is, CLKIN is the same frequency as SYSCLKOUT).

Figure 3-9. Clock and Reset Domains

#### Table 3-15. PLL, Clocking, Watchdog, and Low-Power Mode Registers<sup>(1)</sup>

(1) All of the registers in this table are EALLOW protected.

### 3.6.1 OSC and PLL Block

Figure 3-10 shows the OSC and PLL block on the 280x.

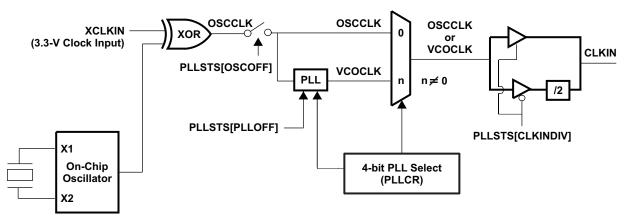

Figure 3-10. OSC and PLL Block Diagram

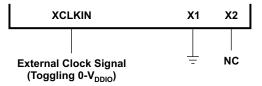

The on-chip oscillator circuit enables a crystal/resonator to be attached to the 280x devices using the X1 and X2 pins. If the on-chip oscillator is not used, an external oscillator can be used in either one of the following configurations:

- 1. A 3.3-V external oscillator can be directly connected to the XCLKIN pin. The X2 pin should be left unconnected and the X1 pin tied low. The logic-high level in this case should not exceed V<sub>DDIO</sub>.
- A 1.8-V external oscillator can be directly connected to the X1 pin. The X2 pin should be left unconnected and the XCLKIN pin tied low. The logic-high level in this case should not exceed V<sub>DD</sub>.

Submit Documentation Feedback Product Folder Link(s): TMS320F2809 TMS320F2808 TMS320F2806 TMS320F2802 TMS320F2801 TMS320C2802 TMS320C2801 TMS320F28016 TMS320F28015

The three possible input-clock configurations are shown in Figure 3-11 through Figure 3-13.

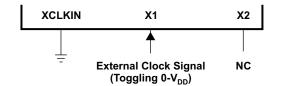

Figure 3-12. Using a 1.8-V External Oscillator

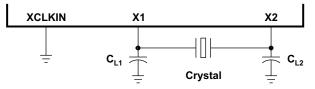

Figure 3-13. Using the Internal Oscillator

#### 3.6.1.1 External Reference Oscillator Clock Option

The typical specifications for the external quartz crystal for a frequency of 20 MHz are listed below:

- Fundamental mode, parallel resonant
- C<sub>L</sub> (load capacitance) = 12 pF
- $C_{L1} = C_{L2} = 24 \text{ pF}$
- C<sub>shunt</sub> = 6 pF
- ESR range = 30 to 60 Ω

TI recommends that customers have the resonator/crystal vendor characterize the operation of their device with the DSP chip. The resonator/crystal vendor has the equipment and expertise to tune the tank circuit. The vendor can also advise the customer regarding the proper tank component values that will produce proper start up and stability over the entire operating range.

#### 3.6.1.2 PLL-Based Clock Module

The 280x devices have an on-chip, PLL-based clock module. This module provides all the necessary clocking signals for the device, as well as control for low-power mode entry. The PLL has a 4-bit ratio control PLLCR[DIV] to select different CPU clock rates. The watchdog module should be disabled before writing to the PLLCR register. It can be re-enabled (if need be) after the PLL module has stabilized, which takes 131072 OSCCLK cycles.

| PLLCR[DIV] <sup>(1)</sup> | SYSCLKOUT<br>(CLKIN) <sup>(2)</sup> |
|---------------------------|-------------------------------------|
| 0000 (PLL bypass)         | OSCCLK/n                            |
| 0001                      | (OSCCLK*1)/n                        |
| 0010                      | (OSCCLK*2)/n                        |
| 0011                      | (OSCCLK*3)/n                        |
| 0100                      | (OSCCLK*4)/n                        |
| 0101                      | (OSCCLK*5)/n                        |
| 0110                      | (OSCCLK*6)/n                        |
| 0111                      | (OSCCLK*7)/n                        |
| 1000                      | (OSCCLK*8)/n                        |
| 1001                      | (OSCCLK*9)/n                        |
| 1010                      | (OSCCLK*10)/n                       |
| 1011–1111                 | Reserved                            |

#### Table 3-16. PLLCR Register Bit Definitions

(1) This register is EALLOW protected.

(2) CLKIN is the input clock to the CPU. SYSCLKOUT is the output clock from the CPU. The frequency of SYSCLKOUT is the same as CLKIN. If CLKINDIV = 0, n = 2; if CLKINDIV = 1, n = 1.

#### NOTE

PLLSTS[CLKINDIV] enables or bypasses the divide-by-two block before the clock is fed to the core. This bit must be 0 before writing to the PLLCR and must only be set after PLLSTS[PLLLOCKS] = 1.

The PLL-based clock module provides two modes of operation:

- Crystal-operation This mode allows the use of an external crystal/resonator to provide the time base to the device.
- External clock source operation This mode allows the internal oscillator to be bypassed. The device clocks are generated from an external clock source input on the X1 or the XCLKIN pin.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

www.ti.com

#### Table 3-17. Possible PLL Configuration Modes

| PLL MODE   | REMARKS   | PLLSTS[CLKINDIV] | SYSCLKOUT<br>(CLKIN) |
|------------|---|------------------|----------------------|
|            | Invoked by the user setting the PLLOFF bit in the PLLSTS register. The PLL block  | 0                | OSCCLK/2             |
| PLL Off    | is disabled in this mode. This can be useful to reduce system noise and for low power operation. The PLLCR register must first be set to 0x0000 (PLL Bypass) before entering this mode. The CPU clock (CLKIN) is derived directly from the input clock on either X1/X2, X1 or XCLKIN. | 1                | OSCCLK               |
|            | PLL Bypass is the default PLL configuration upon power-up or after an external  | 0                | OSCCLK/2             |
| PLL Bypass | reset (XRS). This mode is selected when the PLLCR register is set to 0x0000 or while the PLL locks to a new frequency after the PLLCR register has been modified. In this mode, the PLL itself is bypassed but the PLL is not turned off.   | 1                | OSCCLK               |
| PLL Enable | Achieved by writing a non-zero value n into the PLLCR register. Upon writing to the PLLCR the device will switch to PLL Bypass mode until the PLL locks.  | 0                | OSCCLK*n/2           |

#### 3.6.1.3 Loss of Input Clock

In PLL-enabled and PLL-bypass mode, if the input clock OSCCLK is removed or absent, the PLL will still issue a limp-mode clock. The limp-mode clock continues to clock the CPU and peripherals at a typical frequency of 1–5 MHz. Limp mode is not specified to work from power-up, only after input clocks have been present initially. In PLL bypass mode, the limp mode clock from the PLL is automatically routed to the CPU if the input clock is removed or absent.

Normally, when the input clocks are present, the watchdog counter decrements to initiate a watchdog reset or WDINT interrupt. However, when the external input clock fails, the watchdog counter stops decrementing (i.e., the watchdog counter does not change with the limp-mode clock). In addition to this, the device will be reset and the "Missing Clock Status" (MCLKSTS) bit will be set. These conditions could be used by the application firmware to detect the input clock failure and initiate necessary shut-down procedure for the system.

#### NOTE

Applications in which the correct CPU operating frequency is absolutely critical should implement a mechanism by which the DSP will be held in reset, should the input clocks ever fail. For example, an R-C circuit may be used to trigger the  $\overline{XRS}$  pin of the DSP, should the capacitor ever get fully charged. An I/O pin may be used to discharge the capacitor on a periodic basis to prevent it from getting fully charged. Such a circuit would also help in detecting failure of the flash memory and the V<sub>DD3VFL</sub> rail.

#### 3.6.2 Watchdog Block

The watchdog block on the 280x is similar to the one used on the 240x and 281x devices. The watchdog module generates an output pulse, 512 oscillator clocks wide (OSCCLK), whenever the 8-bit watchdog up counter has reached its maximum value. To prevent this, the user disables the counter or the software must periodically write a 0x55 + 0xAA sequence into the watchdog key register which will reset the watchdog counter. Figure 3-14 shows the various functional blocks within the watchdog module.

A. The WDRST signal is driven low for 512 OSCCLK cycles.

Figure 3-14. Watchdog Module

The WDINT signal enables the watchdog to be used as a wakeup from IDLE/STANDBY mode.

In STANDBY mode, all peripherals are turned off on the device. The only peripheral that remains functional is the watchdog. The WATCHDOG module will run off OSCCLK. The WDINT signal is fed to the LPM block so that it can wake the device from STANDBY (if enabled). See Section 3.7, Low-Power Modes Block, for more details.

In IDLE mode, the WDINT signal can generate an interrupt to the CPU, via the PIE, to take the CPU out of IDLE mode.

In HALT mode, this feature cannot be used because the oscillator (and PLL) are turned off and hence so is the WATCHDOG.

### 3.7 Low-Power Modes Block

The low-power modes on the 280x are similar to the 240x devices. Table 3-18 summarizes the various modes.

| MODE    | LPMCR0(1:0) | OSCCLK   | CLKIN | SYSCLKOUT         | EXIT <sup>(1)</sup>   |
|---------|-------------|--|-------|-------------------|---|
| IDLE    | 00          | On   | On    | On <sup>(2)</sup> | XRS, Watchdog interrupt, any enabled interrupt, XNMI                        |
| STANDBY | 01          | On<br>(watchdog still running)                                     | Off   | Off               | XRS, Watchdog interrupt, GPIO Port A signal, debugger <sup>(3)</sup> , XNMI |
| HALT    | 1X          | Off<br>(oscillator and PLL turned off,<br>watchdog not functional) | Off   | Off               | XRS, GPIO Port A signal, XNMI, debugger <sup>(3)</sup>                      |

#### Table 3-18. Low-Power Modes

(1) The Exit column lists which signals or under what conditions the low power mode will be exited. A low signal, on any of the signals, will exit the low power condition. This signal must be kept low long enough for an interrupt to be recognized by the device. Otherwise the IDLE mode will not be exited and the device will go back into the indicated low power mode.

(2) The IDLE mode on the C28x behaves differently than on the 24x/240x. On the C28x, the clock output from the CPU (SYSCLKOUT) is still functional while on the 24x/240x the clock is turned off.

(3) On the C28x, the JTAG port can still function even if the CPU clock (CLKIN) is turned off.

The various low-power modes operate as follows:

| IDLE Mode:    | This mode is exited by any enabled interrupt or an XNMI that is recognized by the processor. The LPM block performs no tasks during this mode as long as the LPMCR0(LPM) bits are set to 0,0.   |
|---------------|---|
| STANDBY Mode: | Any GPIO port A signal (GPIO[31:0]) can wake the device from STANDBY mode. The user must select which signal(s) will wake the device in the GPIOLPMSEL register. The selected signal(s) are also qualified by the OSCCLK before waking the device. The number of OSCCLKs is specified in the LPMCR0 register. |
| HALT Mode:    | Only the $\overline{XRS}$ and any GPIO port A signal (GPIO[31:0]) can wake the device from HALT mode. The user selects the signal in the GPIOLPMSEL register.   |

#### NOTE

The low-power modes do not affect the state of the output pins (PWM pins included). They will be in whatever state the code left them in when the IDLE instruction was executed. See the *TMS320x280x, 2801x, 2804x DSP System Control and Interrupts Reference Guide* (literature number <u>SPRU712</u>) for more details.

### 4 Peripherals

The integrated peripherals of the 280x are described in the following subsections:

- Three 32-bit CPU-Timers
- Up to six enhanced PWM modules (ePWM1, ePWM2, ePWM3, ePWM4, ePWM5, ePWM6)
- Up to four enhanced capture modules (eCAP1, eCAP2, eCAP3, eCAP4)
- Up to two enhanced QEP modules (eQEP1, eQEP2)
- Enhanced analog-to-digital converter (ADC) module
- Up to two enhanced controller area network (eCAN) modules (eCAN-A, eCAN-B)
- Up to two serial communications interface modules (SCI-A, SCI-B)
- Up to four serial peripheral interface (SPI) modules (SPI-A, SPI-B, SPI-C, SPI-D)
- Inter-integrated circuit module (I2C)
- Digital I/O and shared pin functions

### 4.1 32-Bit CPU-Timers 0/1/2

There are three 32-bit CPU-timers on the 280x devices (CPU-TIMER0/1/2).

CPU-Timer 0 and CPU-Timer 1 can be used in user applications. Timer 2 is reserved for DSP/BIOS<sup>™</sup>. These timers are different from the timers that are present in the ePWM modules.

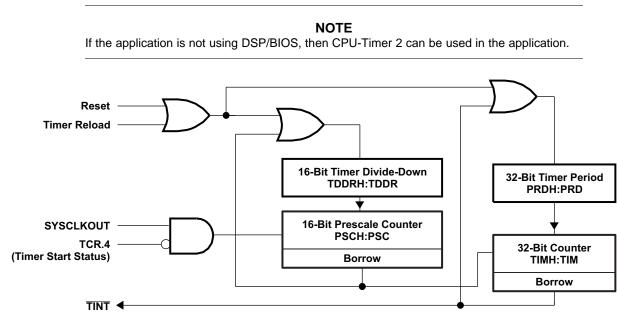

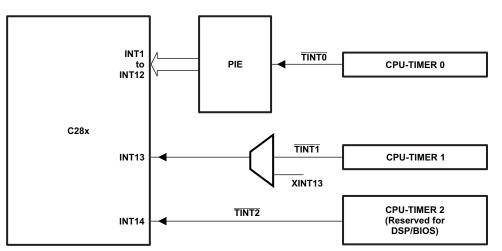

Figure 4-1. CPU-Timers

Texas Instruments

www.ti.com

In the 280x devices, the timer interrupt signals (TINT0, TINT1, TINT2) are connected as shown in Figure 4-2.

- A. The timer registers are connected to the memory bus of the C28x processor.
- B. The timing of the timers is synchronized to SYSCLKOUT of the processor clock.

#### Figure 4-2. CPU-Timer Interrupt Signals and Output Signal

The general operation of the timer is as follows: The 32-bit counter register "TIMH:TIM" is loaded with the value in the period register "PRDH:PRD". The counter register decrements at the SYSCLKOUT rate of the C28x. When the counter reaches 0, a timer interrupt output signal generates an interrupt pulse. The registers listed in Table 4-1 are used to configure the timers. For more information, see the *TMS320x280x*, *2801x*, *2804x DSP System Control and Interrupts Reference Guide* (literature number <u>SPRU712</u>).

### 4.2 Enhanced PWM Modules (ePWM1/2/3/4/5/6)

The 280x device contains up to six enhanced PWM modules (ePWM). Figure 4-3 shows a block diagram of multiple ePWM modules. Figure 4-4 shows the signal interconnections with the ePWM. See the *TMS320x280x, 2801x, 2804x Enhanced Pulse Width Modulator (ePWM) Module Reference Guide* (literature number <u>SPRU791</u>) for more details.

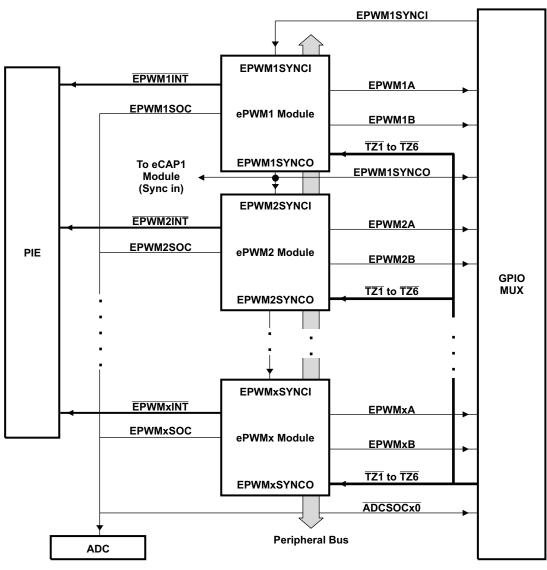

Figure 4-3. Multiple PWM Modules in a 280x System

Table 4-2 shows the complete ePWM register set per module.

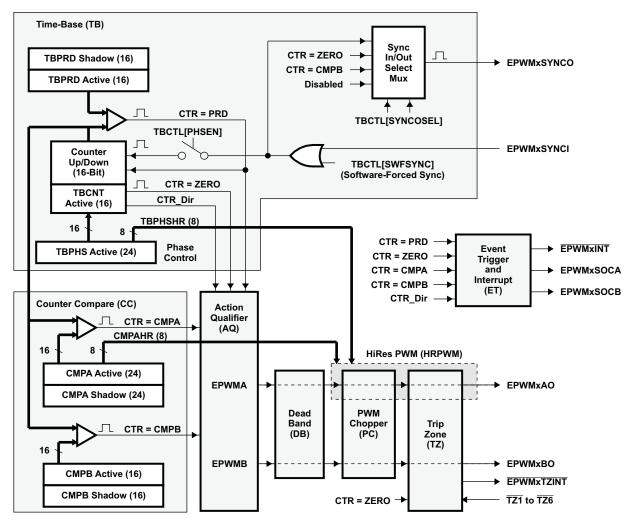

Figure 4-4. ePWM Sub-Modules Showing Critical Internal Signal Interconnections

#### 4.3 Hi-Resolution PWM (HRPWM)

The HRPWM module offers PWM resolution (time granularity) which is significantly better than what can be achieved using conventionally derived digital PWM methods. The key points for the HRPWM module are:

- Significantly extends the time resolution capabilities of conventionally derived digital PWM
- Typically used when effective PWM resolution falls below ~ 9-10 bits. This occurs at PWM frequencies greater than ~200 kHz when using a CPU/System clock of 100 MHz.
- This capability can be utilized in both duty cycle and phase-shift control methods.
- Finer time granularity control or edge positioning is controlled via extensions to the Compare A and Phase registers of the ePWM module.
- HRPWM capabilities are offered only on the A signal path of an ePWM module (i.e., on the EPWMxA output). EPWMxB output has conventional PWM capabilities.

#### 4.4 Enhanced CAP Modules (eCAP1/2/3/4)

The 280x device contains up to four enhanced capture (eCAP) modules. Figure 4-5 shows a functional block diagram of a module. See the TMS320x280x, 2801x, 2804x Enhanced Capture (eCAP) Module Reference Guide (literature number SPRU807) for more details.

The eCAP modules are clocked at the SYSCLKOUT rate.

The clock enable bits (ECAP1/2/3/4ENCLK) in the PCLKCR1 register are used to turn off the eCAP modules individually (for low power operation). Upon reset, ECAP1ENCLK, ECAP2ENCLK, ECAP3ENCLK, and ECAP4ENCLK are set to low, indicating that the peripheral clock is off.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

### 4.6 Enhanced Analog-to-Digital Converter (ADC) Module

A simplified functional block diagram of the ADC module is shown in Figure 4-7. The ADC module consists of a 12-bit ADC with a built-in sample-and-hold (S/H) circuit. Functions of the ADC module include:

- 12-bit ADC core with built-in S/H
- Analog input: 0.0 V to 3.0 V (Voltages above 3.0 V produce full-scale conversion results.)
- Fast conversion rate: Up to 80 ns at 25-MHz ADC clock, 12.5 MSPS
- 16-channel, MUXed inputs
- Autosequencing capability provides up to 16 "autoconversions" in a single session. Each conversion can be programmed to select anyone of 16 input channels
- Sequencer can be operated as two independent 8-channel sequencers or as one large 16-channel sequencer (i.e., two cascaded 8-channel sequencers)
- Sixteen result registers (individually addressable) to store conversion values

Input Analog Voltage – ADCLO

3

- The digital value of the input analog voltage is derived by:

Digital Value = 0,

when input  $\leq$  0 V

when 0 V < input < 3 V

when input  $\geq$  3 V

Digital Value = 4095,

Digital Value = 4096 ×

- A. All fractional values are truncated.
- Multiple triggers as sources for the start-of-conversion (SOC) sequence
  - S/W software immediate start
  - ePWM start of conversion
  - XINT2 ADC start of conversion
- Flexible interrupt control allows interrupt request on every end-of-sequence (EOS) or every other EOS.
- Sequencer can operate in "start/stop" mode, allowing multiple "time-sequenced triggers" to synchronize conversions.
- SOCA and SOCB triggers can operate independently in dual-sequencer mode.
- Sample-and-hold (S/H) acquisition time window has separate prescale control.

The ADC module in the 280x has been enhanced to provide flexible interface to ePWM peripherals. The ADC interface is built around a fast, 12-bit ADC module with a fast conversion rate of up to 80 ns at 25-MHz ADC clock. The ADC module has a 16-channel sequencer, configurable as two independent 8-channel sequencers. The two independent 8-channel sequencers can be cascaded to form a 16-channel sequencer. Although there are multiple input channels and two sequencers, there is only one converter in the ADC module. Figure 4-7 shows the block diagram of the ADC module.

The two 8-channel sequencer modules have the capability to autosequence a series of conversions, each module has the choice of selecting any one of the respective eight channels available through an analog MUX. In the cascaded mode, the autosequencer functions as a single 16-channel sequencer. On each sequencer, once the conversion is complete, the selected channel value is stored in its respective RESULT register. Autosequencing allows the system to convert the same channel multiple times, allowing the user to perform oversampling algorithms. This gives increased resolution over traditional single-sampled conversion results.

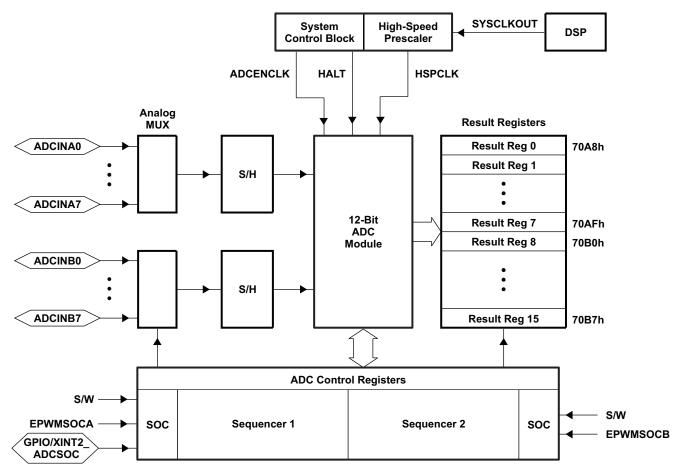

Figure 4-7. Block Diagram of the ADC Module

To obtain the specified accuracy of the ADC, proper board layout is very critical. To the best extent possible, traces leading to the ADCIN pins should not run in close proximity to the digital signal paths. This is to minimize switching noise on the digital lines from getting coupled to the ADC inputs. Furthermore, proper isolation techniques must be used to isolate the ADC module power pins ( $V_{DD1A18}$ ,  $V_{DD2A18}$ ,  $V_{DDA2}$ ,  $V_{DDA10}$ ) from the digital supply. Figure 4-8 and Figure 4-9 show the ADC pin connections for the 280x devices.

#### NOTE

- 1. The ADC registers are accessed at the SYSCLKOUT rate. The internal timing of the ADC module is controlled by the high-speed peripheral clock (HSPCLK).
- 2. The behavior of the ADC module based on the state of the ADCENCLK and HALT signals is as follows:
  - ADCENCLK: On reset, this signal will be low. While reset is active-low (XRS) the clock to the register will still function. This is necessary to make sure all registers and modes go into their default reset state. The analog module, however, will be in a low-power inactive state. As soon as reset goes high, then the clock to the registers will be disabled. When the user sets the ADCENCLK signal high, then the clocks to the registers will be enabled and the analog module will be enabled. There will be a certain time delay (ms range) before the ADC is stable and can be used.
  - HALT: This mode only affects the analog module. It does not affect the registers. In this mode, the ADC module goes into low-power mode. This mode also will stop the clock to the CPU, which will stop the HSPCLK; therefore, the ADC register logic will be turned off indirectly.

- A. TAIYO YUDEN LMK212BJ225MG-T or equivalent
- B. External decoupling capacitors are recommended on all power pins.
- C. Analog inputs must be driven from an operational amplifier that does not degrade the ADC performance.
- D. External voltage on ADCREFIN is enabled by changing bits 15:14 in the ADC Reference Select register depending on the voltage used on this pin. TI recommends TI part REF3020 or equivalent for 2.048-V generation. Overall gain accuracy will be determined by accuracy of this voltage source.

#### Figure 4-9. ADC Pin Connections With External Reference

#### NOTE

The temperature rating of any recommended component must match the rating of the end product.

#### 4.6.1 ADC Connections if the ADC Is Not Used

It is recommended to keep the connections for the analog power pins, even if the ADC is not used. Following is a summary of how the ADC pins should be connected, if the ADC is not used in an application:

- $V_{DD1A18}/V_{DD2A18}$  Connect to  $V_{DD}$
- $V_{DDA2}$ ,  $V_{DDAIO}$  Connect to  $V_{DDIO}$
- $V_{SS1AGND}/V_{SS2AGND}$ ,  $V_{SSA2}$ ,  $V_{SSAIO}$  Connect to  $V_{SS}$
- ADCLO Connect to V<sub>SS</sub>
- ADCREFIN Connect to V<sub>SS</sub>
- ADCREFP/ADCREFM Connect a 100-nF cap to V<sub>SS</sub>
- ADCRESEXT Connect a 20-kΩ resistor (very loose tolerance) to V<sub>SS</sub>.
- ADCINAn, ADCINBn Connect to V<sub>SS</sub>

When the ADC is not used, be sure that the clock to the ADC module is not turned on to realize power savings.

When the ADC module is used in an application, unused ADC input pins should be connected to analog ground ( $V_{SS1AGND}/V_{SS2AGND}$ )

#### Table 4-5. ADC Registers<sup>(1)</sup>

(1) The registers in this column are Peripheral Frame 2 Registers.

(2) The ADC result registers are dual mapped in the 280x DSP. Locations in Peripheral Frame 2 (0x7108-0x7117) are 2 wait-states and left justified. Locations in Peripheral frame 0 space (0x0B00-0x0B0F) are 0 wait sates and right justified. During high-speed/continuous conversion use of the ADC, use the 0 wait-state locations for fast transfer of ADC results to user memory.

#### SPRS230M-OCTOBER 2003-REVISED MARCH 2011

### 4.7 Enhanced Controller Area Network (eCAN) Modules (eCAN-A and eCAN-B)

The CAN module has the following features:

- Fully compliant with CAN protocol, version 2.0B
- Supports data rates up to 1 Mbps
- Thirty-two mailboxes, each with the following properties:
  - Configurable as receive or transmit
  - Configurable with standard or extended identifier
  - Has a programmable receive mask
  - Supports data and remote frame
  - Composed of 0 to 8 bytes of data
  - Uses a 32-bit time stamp on receive and transmit message
  - Protects against reception of new message
  - Holds the dynamically programmable priority of transmit message
  - Employs a programmable interrupt scheme with two interrupt levels
  - Employs a programmable alarm on transmission or reception time-out
- Low-power mode
- Programmable wake-up on bus activity
- Automatic reply to a remote request message
- Automatic retransmission of a frame in case of loss of arbitration or error
- 32-bit local network time counter synchronized by a specific message (communication in conjunction with mailbox 16)
- Self-test mode
  - Operates in a loopback mode receiving its own message. A "dummy" acknowledge is provided, thereby eliminating the need for another node to provide the acknowledge bit.

#### NOTE

For a SYSCLKOUT of 100 MHz, the smallest bit rate possible is 15.625 kbps.

For a SYSCLKOUT of 60 MHz, the smallest bit rate possible is 9.375 kbps.

#### NOTE

If the eCAN module is not used in an application, the RAM available (LAM, MOTS, MOTO, and mailbox RAM) can be used as general-purpose RAM. The CAN module clock should be enabled for this.

Figure 4-12. eCAN-B Memory Map

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

The CAN registers listed in Table 4-7 are used by the CPU to configure and control the CAN controller and the message objects. eCAN control registers only support 32-bit read/write operations. Mailbox RAM can be accessed as 16 bits or 32 bits. 32-bit accesses are aligned to an even boundary.

| REGISTER NAME | eCAN-A<br>ADDRESS | eCAN-B<br>ADDRESS | SIZE<br>(x32) | DESCRIPTION                               |

### Table 4-7. CAN Register Map<sup>(1)</sup>

(1) These registers are mapped to Peripheral Frame 1.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

### 4.8 Serial Communications Interface (SCI) Modules (SCI-A, SCI-B)

The 280x devices include two serial communications interface (SCI) modules. The SCI modules support digital communications between the CPU and other asynchronous peripherals that use the standard non-return-to-zero (NRZ) format. The SCI receiver and transmitter are double-buffered, and each has its own separate enable and interrupt bits. Both can be operated independently or simultaneously in the full-duplex mode. To ensure data integrity, the SCI checks received data for break detection, parity, overrun, and framing errors. The bit rate is programmable to over 65000 different speeds through a 16-bit baud-select register.

Features of each SCI module include:

- Two external pins:
  - SCITXD: SCI transmit-output pin
  - SCIRXD: SCI receive-input pin
     NOTE: Both pins can be used as GPIO if not used for SCI.
  - Baud rate programmable to 64K different rates:

Baud rate = 
$$\frac{\text{LSPCLK}}{(\text{BRR}+1)*8}$$
 when  $\text{BRR} \neq 0$ 

Baud rate = 
$$\frac{\text{LSPCLK}}{16}$$
 when BRR = 0

- Data-word format
  - One start bit
  - Data-word length programmable from one to eight bits
  - Optional even/odd/no parity bit
  - One or two stop bits
- Four error-detection flags: parity, overrun, framing, and break detection
- · Two wake-up multiprocessor modes: idle-line and address bit
- Half- or full-duplex operation
- Double-buffered receive and transmit functions
- Transmitter and receiver operations can be accomplished through interrupt-driven or polled algorithms with status flags.
  - Transmitter: TXRDY flag (transmitter-buffer register is ready to receive another character) and TX EMPTY flag (transmitter-shift register is empty)
  - Receiver: RXRDY flag (receiver-buffer register is ready to receive another character), BRKDT flag (break condition occurred), and RX ERROR flag (monitoring four interrupt conditions)
- Separate enable bits for transmitter and receiver interrupts (except BRKDT)

Max bit rate = 
$$\frac{100 \text{ MHz}}{16}$$
 = 6.25 × 10<sup>6</sup> b/s (for 100 - MHz devices)

Max bit rate =  $\frac{60 \text{ MHz}}{16}$  = 3.75 × 10<sup>6</sup> b/s (for 60 - MHz devices)

- NRZ (non-return-to-zero) format
- Ten SCI module control registers located in the control register frame beginning at address 7050h

#### NOTE

All registers in this module are 8-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

Copyright © 2003–2011, Texas Instruments Incorporated

TEXAS INSTRUMENTS

www.ti.com

Enhanced features:

- Auto baud-detect hardware logic
- 16-level transmit/receive FIFO

The SCI port operation is configured and controlled by the registers listed in Table 4-8 and Table 4-9.

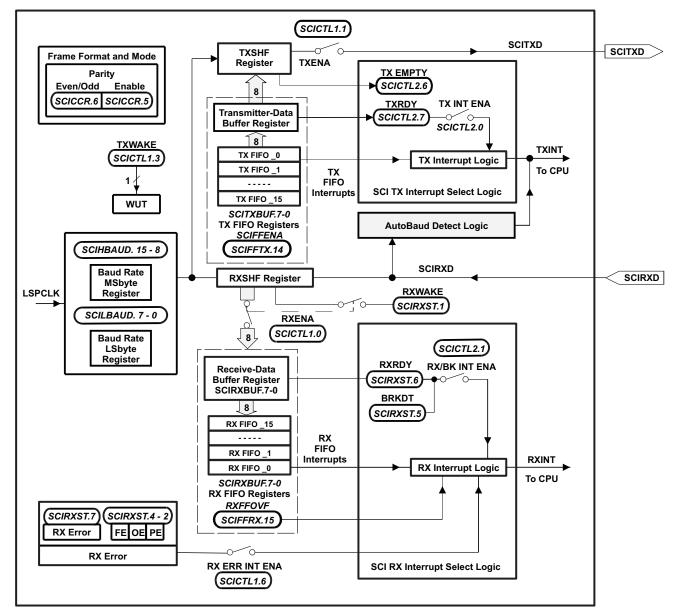

Figure 4-13. Serial Communications Interface (SCI) Module Block Diagram

### 4.9 Serial Peripheral Interface (SPI) Modules (SPI-A, SPI-B, SPI-C, SPI-D)

The 280x devices include the four-pin serial peripheral interface (SPI) module. Up to four SPI modules (SPI-A, SPI-B, SPI-C, and SPI-D) are available. The SPI is a high-speed, synchronous serial I/O port that allows a serial bit stream of programmed length (one to sixteen bits) to be shifted into and out of the device at a programmable bit-transfer rate. Normally, the SPI is used for communications between the DSP controller and external peripherals or another processor. Typical applications include external I/O or peripheral expansion through devices such as shift registers, display drivers, and ADCs. Multidevice communications are supported by the master/slave operation of the SPI.

The SPI module features include:

- Four external pins:
  - SPISOMI: SPI slave-output/master-input pin
  - SPISIMO: SPI slave-input/master-output pin
  - SPISTE: SPI slave transmit-enable pin
  - SPICLK: SPI serial-clock pin

NOTE: All four pins can be used as GPIO, if the SPI module is not used.

- Two operational modes: master and slave
  - Baud rate: 125 different programmable rates.

Baud rate = 
$$\frac{\text{LSPCLK}}{(\text{SPIBRR} + 1)}$$
when SPIBRR = 3 to 127Baud rate =  $\frac{\text{LSPCLK}}{4}$ when SPIBRR = 0, 1, 2

- Data word length: one to sixteen data bits
- Four clocking schemes (controlled by clock polarity and clock phase bits) include:
  - Falling edge without phase delay: SPICLK active-high. SPI transmits data on the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
  - Falling edge with phase delay: SPICLK active-high. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
  - Rising edge without phase delay: SPICLK inactive-low. SPI transmits data on the rising edge of the SPICLK signal and receives data on the falling edge of the SPICLK signal.
  - Rising edge with phase delay: SPICLK inactive-low. SPI transmits data one half-cycle ahead of the falling edge of the SPICLK signal and receives data on the rising edge of the SPICLK signal.
- Simultaneous receive and transmit operation (transmit function can be disabled in software)
- Transmitter and receiver operations are accomplished through either interrupt-driven or polled algorithms.
- Nine SPI module control registers: Located in control register frame beginning at address 7040h.

#### NOTE

All registers in this module are 16-bit registers that are connected to Peripheral Frame 2. When a register is accessed, the register data is in the lower byte (7–0), and the upper byte (15–8) is read as zeros. Writing to the upper byte has no effect.

#### Enhanced feature:

- 16-level transmit/receive FIFO
- Delayed transmit control

### 4.10 Inter-Integrated Circuit (I2C)

The 280x device contains one I2C Serial Port. Figure 4-15 shows how the I2C peripheral module interfaces within the 280x device.

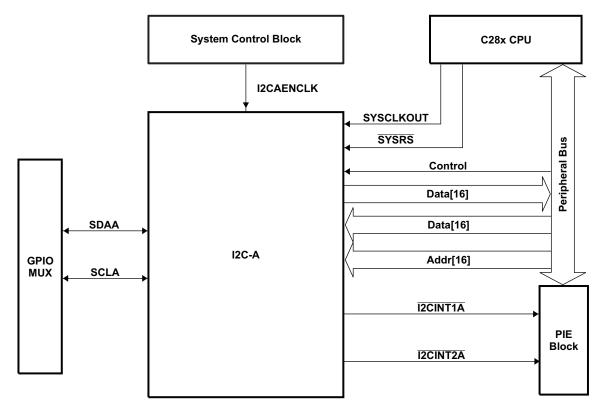

The I2C module has the following features:

- Compliance with the Philips Semiconductors I2C-bus specification (version 2.1):
  - Support for 1-bit to 8-bit format transfers
  - 7-bit and 10-bit addressing modes
  - General call
  - START byte mode
  - Support for multiple master-transmitters and slave-receivers
  - Support for multiple slave-transmitters and master-receivers
  - Combined master transmit/receive and receive/transmit mode
  - Data transfer rate of from 10 kbps up to 400 kbps (I2C Fast-mode rate)
- One 16-word receive FIFO and one 16-word transmit FIFO
- One interrupt that can be used by the CPU. This interrupt can be generated as a result of one of the following conditions:
  - Transmit-data ready
  - Receive-data ready
  - Register-access ready
  - No-acknowledgment received
  - Arbitration lost
  - Stop condition detected
  - Addressed as slave
- An additional interrupt that can be used by the CPU when in FIFO mode
- Module enable/disable capability
- Free data format mode

### TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

- A. The I2C registers are accessed at the SYSCLKOUT rate. The internal timing and signal waveforms of the I2C port are also at the SYSCLKOUT rate.
- B. The clock enable bit (I2CAENCLK) in the PCLKCRO register turns off the clock to the I2C port for low power operation. Upon reset, I2CAENCLK is clear, which indicates the peripheral internal clocks are off.

#### Figure 4-15. I2C Peripheral Module Interfaces

The registers in Table 4-14 configure and control the I2C port operation.

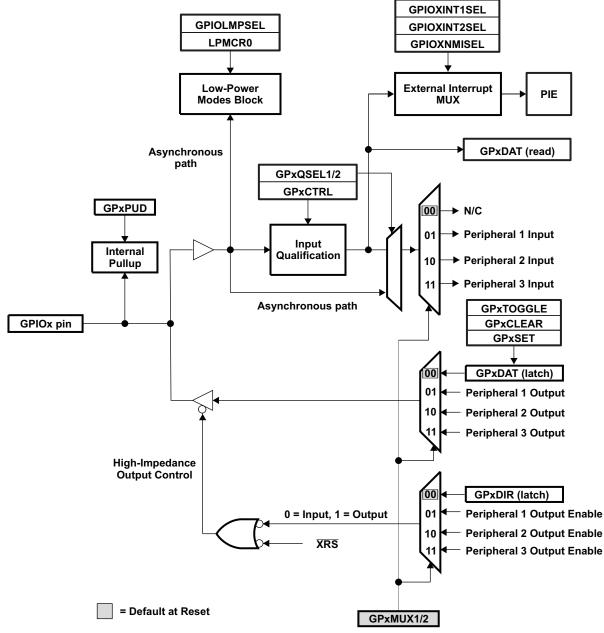

#### Table 4-14. I2C-A Registers

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

#### 4.11 GPIO MUX

On the 280x, the GPIO MUX can multiplex up to three independent peripheral signals on a single GPIO pin in addition to providing individual pin bit-banging IO capability. The GPIO MUX block diagram per pin is shown in Figure 4-16. Because of the open-drain capabilities of the I2C pins, the GPIO MUX block diagram for these pins differ. See the *TMS320x280x, 2801x, 2804x DSP System Control and Interrupts Reference Guide* (literature number SPRU712) for details.

- A. x stands for the port, either A or B. For example, GPxDIR refers to either the GPADIR and GPBDIR register depending on the particular GPIO pin selected.
- B. GPxDAT latch/read are accessed at the same memory location.

#### Figure 4-16. GPIO MUX Block Diagram

# TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

The 280x supports 34 GPIO pins. The GPIO control and data registers are mapped to Peripheral Frame 1 to enable 32-bit operations on the registers (along with 16-bit operations). Table 4-15 shows the GPIO register mapping.

| NAME         | ADDRESS            | SIZE (x16)   | DESCRIPTION                                       |

(1) GPxMUX1/2 refers to the appropriate MUX register for the pin; GPAMUX1, GPAMUX2 or GPBMUX1.

(2) This table pertains to the 2808 device. Some peripherals may not be available in the 2809, 2806, 2802, or 2801 devices. See the pin descriptions for more detail.

(3) The word "Reserved" means that there is no peripheral assigned to this GPxMUX1/2 register setting. Should it be selected, the state of the pin will be undefined and the pin may be driven. This selection is a reserved configuration for future expansion.

(4) The word "Reserved" means that there is no peripheral assigned to this GPxMUX1/2 register setting. Should it be selected, the state of the pin will be undefined and the pin may be driven. This selection is a reserved configuration for future expansion.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

The user can select the type of input qualification for each GPIO pin via the GPxQSEL1/2 registers from four choices:

- Synchronization To SYSCLKOUT Only (GPxQSEL1/2 = 0,0): This is the default mode of all GPIO pins at reset and it simply synchronizes the input signal to the system clock (SYSCLKOUT).
- Qualification Using Sampling Window (GPxQSEL1/2 = 0,1 and 1,0): In this mode the input signal, after synchronization to the system clock (SYSCLKOUT), is qualified by a specified number of cycles before the input is allowed to change.

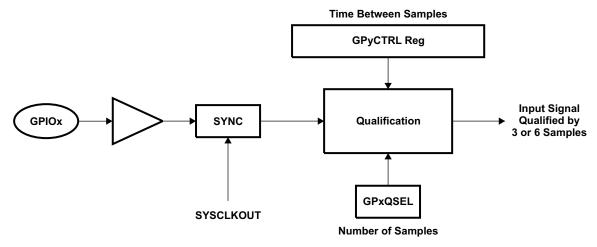

Figure 4-17. Qualification Using Sampling Window

- The sampling period is specified by the QUALPRD bits in the GPxCTRL register and is configurable in groups of 8 signals. It specifies a multiple of SYSCLKOUT cycles for sampling the input signal. The sampling window is either 3-samples or 6-samples wide and the output is only changed when ALL samples are the same (all 0s or all 1s) as shown in Figure 6-12 (for 6-sample mode).
- No Synchronization (GPxQSEL1/2 = 1,1): This mode is used for peripherals where synchronization is not required (synchronization is performed within the peripheral).

Due to the multi-level multiplexing that is required on the 280x device, there may be cases where a peripheral input signal can be mapped to more then one GPIO pin. Also, when an input signal is not selected, the input signal will default to either a 0 or 1 state, depending on the peripheral.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

### 5 Device Support

Texas Instruments (TI) offers an extensive line of development tools for the C28x<sup>™</sup> generation of DSPs, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of 280x-based applications:

#### Software Development Tools

- Code Composer Studio<sup>™</sup> Integrated Development Environment (IDE)
  - C/C++ Compiler
  - Code generation tools
  - Assembler/Linker
  - Cycle Accurate Simulator
- Application algorithms
- Sample applications code

#### Hardware Development Tools

- 2808 eZdsp™
- Evaluation modules
- JTAG-based emulators SPI515, XDS510PP, XDS510PP Plus, XDS510USB
- Universal 5-V dc power supply
- Documentation and cables

#### 5.1 Device and Development Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320<sup>™</sup> DSP devices and support tools. Each TMS320<sup>™</sup> DSP commercial family member has one of three prefixes: TMX, TMP, or TMS (e.g., **TMS**320F2808). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

- **TMX** Experimental device that is not necessarily representative of the final device's electrical specifications
- **TMP** Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification
- **TMS** Fully qualified production device

Support tool development evolutionary flow:

- **TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing
- **TMDS** Fully qualified development-support product

TMX and TMP devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

86 Device Support

### TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, PZ) and temperature range (for example, S). Figure 5-1 provides a legend for reading the complete device name for any family member.

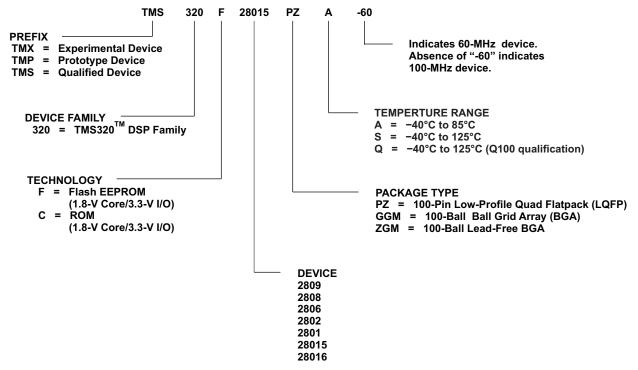

Figure 5-1. Example of TMS320x280x/2801x Device Nomenclature

#### 5.2 Documentation Support

Extensive documentation supports all of the TMS320<sup>™</sup> DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets and data manuals, with design specifications; and hardware and software applications.

Table 5-1 shows the peripheral reference guides appropriate for use with the devices in this data manual. See the *TMS320x28xx*, *28xxx DSP Peripheral Reference Guide* (literature number <u>SPRU566</u>) for more information on types of peripherals.

#### Table 5-1. TMS320x280x, 2801x Peripheral Selection Guide

(1) A type change represents a major functional feature difference in a peripheral module. Within a peripheral type, there may be minor differences between devices that do not affect the basic functionality of the module. These device-specific differences are listed in the TMS320x28xx, 28xxx DSP Peripheral Reference Guide (literature number SPRU566) and in the peripheral reference guides.

The following documents are available on the TI website (www.ti.com):

#### **CPU User's Guides**

- <u>SPRU430</u> TMS320C28x CPU and Instruction Set Reference Guide describes the central processing unit (CPU) and the assembly language instructions of the TMS320C28x fixed-point digital signal processors (DSPs). It also describes emulation features available on these DSPs.
- <u>SPRU712</u> TMS320x280x, 2801x, 2804x DSP System Control and Interrupts Reference Guide describes the various interrupts and system control features of the 280x digital signal processors (DSPs).

#### **Peripheral Guides**

- SPRU566 TMS320x28xx, 28xxx DSP Peripheral Reference Guide describes the peripheral reference guides of the 28x digital signal processors (DSPs).
- SPRU716 TMS320x280x, 2801x, 2804x DSP Analog-to-Digital Converter (ADC) Reference Guide describes how to configure and use the on-chip ADC module, which is a 12-bit pipelined ADC.
- <u>SPRU791</u> TMS320x280x, 2801x, 2804x Enhanced Pulse Width Modulator (ePWM) Module Reference Guide describes the main areas of the enhanced pulse width modulator that include digital motor control, switch mode power supply control, UPS (uninterruptible power supplies), and other forms of power conversion

- <u>SPRU790</u> TMS320x280x, 2801x, 2804x Enhanced Quadrature Encoder Pulse (eQEP) Module Reference Guide describes the eQEP module, which is used for interfacing with a linear or rotary incremental encoder to get position, direction, and speed information from a rotating machine in high performance motion and position control systems. It includes the module description and registers
- SPRU807 TMS320x280x, 2801x, 2804x Enhanced Capture (eCAP) Module Reference Guide describes the enhanced capture module. It includes the module description and registers.
- SPRU924 TMS320x280x, 2801x, 2804x High-Resolution Pulse Width Modulator Reference Guide describes the operation of the high-resolution extension to the pulse width modulator (HRPWM).
- **SPRUEU0 TMS320x280x/2801x Enhanced Controller Area Network (eCAN) Reference Guide** describes the enhanced controller area network (eCAN) on the x280x and x2801x devices.
- SPRUFK7 TMS320x280x, 2801x, 2804x Serial Communication Interface (SCI) Reference Guide describes the features and operation of the serial communication interface (SCI) module that is available on the TMS320x280x, 2801x, 2804x devices.
- SPRUG72 TMS320x280x, 2801x, 2804x Serial Peripheral Interface Reference Guide describes how the serial peripheral interface works.
- SPRU721 TMS320x28xx, 28xxx Inter-Integrated Circuit (I2C) Module Reference Guide describes the features and operation of the inter-integrated circuit (I2C) module.
- **SPRU722 TMS320x280x, 2801x, 2804x Boot ROM Reference Guide** describes the purpose and features of the bootloader (factory-programmed boot-loading software). It also describes other contents of the device on-chip boot ROM and identifies where all of the information is located within that memory.

#### Tools Guides

- <u>SPRU513</u> TMS320C28x Assembly Language Tools v5.0.0 User's Guide describes the assembly language tools (assembler and other tools used to develop assembly language code), assembler directives, macros, common object file format, and symbolic debugging directives for the TMS320C28x device.
- SPRU514 TMS320C28x Optimizing C/C++ Compiler v5.0.0 User's Guide describes the TMS320C28x<sup>™</sup> C/C++ compiler. This compiler accepts ANSI standard C/C++ source code and produces TMS320 DSP assembly language source code for the TMS320C28x device.
- SPRU608 TMS320C28x Instruction Set Simulator Technical Overview describes the simulator, available within the Code Composer Studio for TMS320C2000 IDE, that simulates the instruction set of the C28x<sup>™</sup> core.
- SPRU625 TMS320C28x DSP/BIOS 5.32 Application Programming Interface (API) Reference Guide describes development using DSP/BIOS.

- 4. DSP Power Management Reference Designs www.ti.com/dsppower
- **SPRAAQ7 TMS320x281x to TMS320x2833x or 2823x Migration Overview** describes how to migrate from the 281x device design to 2833x or 2823x designs.
- SPRAAQ8 TMS320x280x to TMS320x2833x or 2823x Migration Overview describes how to migrate from a 280x device design to 2833x or 2823x designs.
- SPRAAN9 C28x FPU Primer provides an overview of the floating-point unit (FPU) in the TMS320F28335, TMS320F28334, and TMS320F28332 Digital Signal Controller (DSC) devices.
- SPRAAMO Getting Started With TMS320C28x Digital Signal Controllers is organized by development flow and functional areas to make your design effort as seamless as possible. Tips on getting started with C28x<sup>™</sup> DSP software and hardware development are provided to aid in your initial design and debug efforts. Each section includes pointers to valuable information including technical documentation, software, and tools for use in each phase of design.
- SPRA958 Running an Application from Internal Flash Memory on the TMS320F28xxx DSP covers the requirements needed to properly configure application software for execution from on-chip flash memory. Requirements for both DSP/BIOS<sup>™</sup> and non-DSP/BIOS projects are presented. Example code projects are included.
- **SPRAA85 Programming TMS320x28xx and 28xxx Peripherals in C/C++** explores a hardware abstraction layer implementation to make C/C++ coding easier on 28x DSPs. This method is compared to traditional #define macros and topics of code efficiency and special case registers are also addressed.
- SPRAA88 Using PWM Output as a Digital-to-Analog Converter on a TMS320F280x Digital Signal Controller presents a method for utilizing the on-chip pulse width modulated (PWM) signal generators on the TMS320F280x family of digital signal controllers as a digital-to-analog converter (DAC).
- SPRAA91 TMS320F280x Digital Signal Controller USB Connectivity Using the TUSB3410 USB-to-UART Bridge Chip presents hardware connections as well as software preparation and operation of the development system using a simple communication echo program.
- SPRAAH1 Using the Enhanced Quadrature Encoder Pulse (eQEP) Module in TMS320x280x, 28xxx as a Dedicated Capture provides a guide for the use of the eQEP module as a dedicated capture unit and is applicable to the TMS320x280x, 28xxx family of processors.
- SPRAAI1 Using the ePWM Module for 0% 100% Duty Cycle Control provides a guide for the use of the ePWM module to provide 0% to 100% duty cycle control and is applicable to the TMS320x280x family of processors.
- SPRAAD5 Power Line Communication for Lighting Applications Using Binary Phase Shift Keying (BPSK) with a Single DSP Controller presents a complete implementation of a power line modem following CEA-709 protocol using a single DSP.
- **SPRAAD8 TMS320x280x and TMS320F2801x ADC Calibration** describes a method for improving the absolute accuracy of the 12-bit ADC found on the TMS320x280x and TMS320F2801x devices. Inherent gain and offset errors affect the absolute accuracy of the ADC. The methods described in this report can improve the absolute accuracy of the ADC to levels

### 6 Electrical Specifications

This section provides the absolute maximum ratings and the recommended operating conditions for the TMS320F280x DSPs.

### 6.1 Absolute Maximum Ratings<sup>(1) (2)</sup>

Unless otherwise noted, the list of absolute maximum ratings are specified over operating temperature ranges.

| Supply voltage range, V <sub>DDIO</sub> , V <sub>DD3VFL</sub>  | with respect to $V_{SS}$                                 | –0.3 V to 4.6 V |
|--|--|-----------------|
| Supply voltage range, V <sub>DDA2</sub> , V <sub>DDAIO</sub>   | with respect to V <sub>SSA</sub>                         | –0.3 V to 4.6 V |
| Supply voltage range, V <sub>DD</sub>  | with respect to $V_{SS}$                                 | –0.3 V to 2.5 V |
| Supply voltage range, V <sub>DD1A18</sub> , V <sub>DD2A18</sub>  | with respect to V <sub>SSA</sub>                         | –0.3 V to 2.5 V |
| Supply voltage range, V <sub>SSA2</sub> , V <sub>SSAIO</sub> , V <sub>SS1AGND</sub> , V <sub>SS2AGND</sub> | with respect to V <sub>SS</sub>                          | –0.3 V to 0.3 V |
| Input voltage range, V <sub>IN</sub>   |  | –0.3 V to 4.6 V |
| Output voltage range, V <sub>O</sub>   |  | –0.3 V to 4.6 V |
| Input clamp current, $I_{IK}$ ( $V_{IN} < 0$ or $V_{IN} > V_{DDIO}$ ) <sup>(3)</sup>                       |  | ±20 mA          |
| Output clamp current, $I_{OK}$ (V <sub>O</sub> < 0 or V <sub>O</sub> > V <sub>DDIO</sub> )                 |  | ±20 mA          |
| Operating ambient temperature ranges   | T <sub>A</sub> : A version (GGM, ZGM, PZ) <sup>(4)</sup> | -40°C to 85°C   |
|  | T <sub>A</sub> : S version (GGM, ZGM, PZ) <sup>(4)</sup> | -40°C to 125°C  |
|  | T <sub>A</sub> : Q version (PZ) <sup>(4)</sup>           | -40°C to 125°C  |
| Junction temperature range, T <sub>J</sub> <sup>(4)</sup>  |  | -40°C to 150°C  |
| Storage temperature range, T <sub>stg</sub> <sup>(4)</sup>   |  | -65°C to 150°C  |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Section 6.2 is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to  $V_{SS}$ , unless otherwise noted.

(3) Continuous clamp current per pin is ±2 mA. This includes the analog inputs which have an internal clamping circuit that clamps the voltage to a diode drop above V<sub>DDA2</sub> or below V<sub>SSA2</sub>.

(4) Long-term high-temperature storage and/or extended use at maximum temperature conditions may result in a reduction of overall device life. For additional information, see IC Package Thermal Metrics Application Report (literature number <u>SPRA953</u>) and Reliability Data for TMS320LF24xx and TMS320F28xx Devices Application Report (literature number <u>SPRA963</u>).

(1) I<sub>DDIO</sub> current is dependent on the electrical loading on the I/O pins.

(2) The I<sub>DD3VFL</sub> current indicated in this table is the flash read-current and does not include additional current for erase/write operations. During flash programming, extra current is drawn from the V<sub>DD</sub> and V<sub>DD3VFL</sub> rails, as indicated in Table 6-45. If the user application involves on-board flash programming, this extra current must be taken into account while architecting the power-supply stage.

(3) I<sub>DDA18</sub> includes current into V<sub>DD1A18</sub> and V<sub>DD2A18</sub> pins. In order to realize the I<sub>DDA18</sub> currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.

(4)  $I_{DDA33}$  includes current into  $V_{DDA2}$  and  $V_{DDAIO}$  pins.

(5) TYP numbers are applicable over room temperature and nominal voltage.

(6) MAX numbers are at 125°C and MAX voltage.

#### NOTE

The peripheral - I/O multiplexing implemented in the 280x devices prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

I<sub>DDIO</sub> current is dependent on the electrical loading on the I/O pins. (1)

(2) I<sub>DDA18</sub> includes current into V<sub>DD1A18</sub> and V<sub>DD2A18</sub> pins. In order to realize the I<sub>DDA18</sub> currents shown for IDLE, STANDBY, and HALT, clock to the ADC module must be turned off explicitly by writing to the PCLKCR0 register.

(3)

 $I_{DDA33}$  includes current into  $V_{DDA2}$  and  $V_{DDAIO}$  pins. TYP numbers are applicable over room temperature and nominal voltage. (4)

(5) MAX numbers are at 125°C and MAX voltage.

#### NOTE

The peripheral - I/O multiplexing implemented in the 280x devices prevents all available peripherals from being used at the same time. This is because more than one peripheral function may share an I/O pin. It is, however, possible to turn on the clocks to all the peripherals at the same time, although such a configuration is not useful. If this is done, the current drawn by the device will be more than the numbers specified in the current consumption tables.

#### 6.4.1 Reducing Current Consumption

280x devices have a richer peripheral mix compared to the 281x family. While the McBSP has been removed, the following new peripherals have been added on the 280x:

- 3 SPI modules
- 1 CAN module
- 1 I2C module

The two event manager modules of the 281x have been enhanced and replaced with separate ePWM (6), eCAP (4) and eQEP (2) modules, providing tremendous flexibility in applications. Like 281x, 280x DSPs incorporate a unique method to reduce the device current consumption. Since each peripheral unit has an individual clock-enable bit, significant reduction in current consumption can be achieved by turning off the clock to any peripheral module that is not used in a given application. Furthermore, any one of the three low-power modes could be taken advantage of to reduce the current consumption even further. Table 6-5 indicates the typical reduction in current consumption achieved by turning off the clocks.

| PERIPHERAL<br>MODULE | I <sub>DD</sub> CURRENT<br>REDUCTION (mA) <sup>(2)</sup> |
|----------------------|--|
| ADC                  | 8 <sup>(3)</sup>   |
| I2C                  | 5  |
| eQEP                 | 5  |
| ePWM                 | 5  |
| eCAP                 | 2  |
| SCI                  | 4  |
| SPI                  | 5  |
| eCAN                 | 11   |

# Table 6-5. Typical Current Consumption by VariousPeripherals (at 100 MHz)<sup>(1)</sup>

 All peripheral clocks are disabled upon reset. Writing to/reading from peripheral registers is possible only after the peripheral clocks are turned on.

(2) For peripherals with multiple instances, the current quoted is per module. For example, the 5 mA number quoted for ePWM is for one ePWM module.

#### NOTE

 $I_{\text{DDIO}}$  current consumption is reduced by 15 mA (typical) when XCLKOUT is turned off.

#### NOTE

The baseline  $I_{DD}$  current (current when the core is executing a dummy loop with no peripherals enabled) is 110 mA, typical. To arrive at the  $I_{DD}$  current for a given application, the current-drawn by the peripherals (enabled by that application) must be added to the baseline  $I_{DD}$  current.

Copyright © 2003–2011, Texas Instruments Incorporated

<sup>(3)</sup> This number represents the current drawn by the digital portion of the ADC module. Turning off the clock to the ADC module results in the elimination of the current drawn by the analog portion of the ADC (I<sub>DDA18</sub>) as well.

#### 6.4.2 Current Consumption Graphs

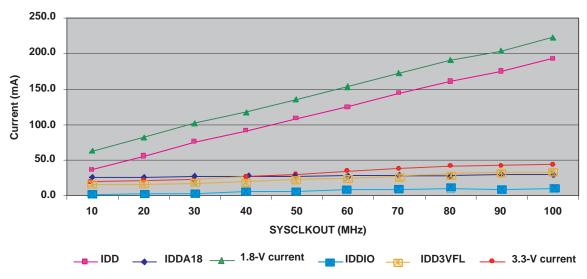

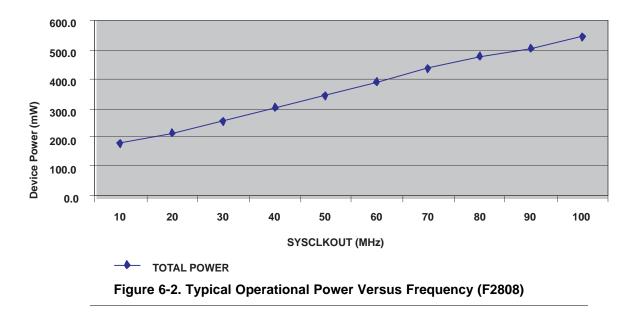

Figure 6-1. Typical Operational Current Versus Frequency (F2808)

#### NOTE

Typical operational current for 60-MHz devices can be estimated from Figure 6-1. For  $I_{DD}$  current alone, subtract the current contribution of non-existent peripherals after scaling the peripheral currents for 60 MHz. For example, to compute the current of F2801-60 device, the contribution by the following peripherals must be subtracted from  $I_{DD}$ : ePWM4/5/6, eCAP3/4, eQEP2, SCI-B.

#### 6.5 Emulator Connection Without Signal Buffering for the DSP

Figure 6-5 shows the connection between the DSP and JTAG header for a single-processor configuration. If the distance between the JTAG header and the DSP is greater than 6 inches, the emulation signals must be buffered. If the distance is less than 6 inches, buffering is typically not needed. Figure 6-5 shows the simpler, no-buffering situation. For the pullup/pulldown resistor values, see the pin description section.

### 6.6 Timing Parameter Symbology

Timing parameter symbols used are created in accordance with JEDEC Standard 100. To shorten the symbols, some of the pin names and other related terminology have been abbreviated as follows:

| Lowerca<br>meaning | se subscripts and their<br>s: | Letters a meaning | and symbols and their<br>ls:           |
|--------------------|-------------------------------|-------------------|--|
| а                  | access time                   | Н                 | High                                   |
| С                  | cycle time (period)           | L                 | Low                                    |
| d                  | delay time                    | V                 | Valid                                  |
| f                  | fall time                     | х                 | Unknown, changing, or don't care level |
| h                  | hold time                     | Z                 | High impedance                         |
| r                  | rise time                     |                   |  |
| su                 | setup time                    |                   |  |
| t                  | transition time               |                   |  |
| v                  | valid time                    |                   |  |
| w                  | pulse duration (width)        |                   |  |

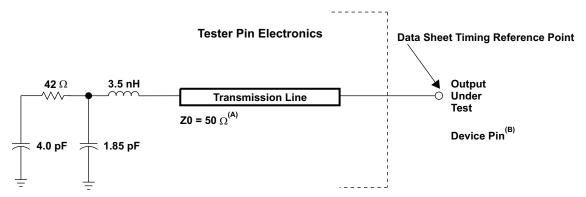

### 6.6.1 General Notes on Timing Parameters

All output signals from the 28x devices (including XCLKOUT) are derived from an internal clock such that all output transitions for a given half-cycle occur with a minimum of skewing relative to each other.

The signal combinations shown in the following timing diagrams may not necessarily represent actual cycles. For actual cycle examples, see the appropriate cycle description section of this document.

#### 6.6.2 Test Load Circuit

This test load circuit is used to measure all switching characteristics provided in this document.

A. Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

B. The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timing.

| XCLKOUT                    | Frequency  | 0.5  |                   | 100  | MHz  |
| HSPCLK <sup>(2)</sup>      | t <sub>c(HCO)</sub> , Cycle time                               | 10   | 20 <sup>(3)</sup> |      | ns   |
| HSPULK                     | Frequency  |      | 50 <sup>(3)</sup> | 100  | MHz  |
| 1 0 D O L K <sup>(2)</sup> | t <sub>c(LCO)</sub> , Cycle time                               | 10   | 40 <sup>(3)</sup> |      | ns   |
| LSPCLK <sup>(2)</sup>      | Frequency  |      | 25 <sup>(3)</sup> | 100  | MHz  |
|                            | t <sub>c(ADCCLK)</sub> , Cycle time (All devices except F2809) | 80   |                   |      | ns   |
|                            | Frequency (All devices except F2809)                           |      |                   | 12.5 | MHz  |
| ADC clock                  | t <sub>c(ADCCLK)</sub> , Cycle time (F2809)                    | 40   |                   |      | ns   |
|                            | Frequency (F2809)  |      |                   | 25   | MHz  |

(1) This also applies to the X1 pin if a 1.8-V oscillator is used.

(2) Lower LSPCLK and HSPCLK will reduce device power consumption.

(3) This is the default reset value if SYSCLKOUT = 100 MHz.

#### Table 6-7. TMS320x280x/2801x Clock Table and Nomenclature (60-MHz Devices)

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

A. The relationship of XCLKIN to XCLKOUT depends on the divide factor chosen. The waveform relationship shown is intended to illustrate the timing parameters only and may differ based on actual configuration.

B. XCLKOUT configured to reflect SYSCLKOUT.

#### Figure 6-7. Clock Timing

#### 6.8 Power Sequencing

No requirements are placed on the power up/down sequence of the various power pins to ensure the correct reset state for all the modules. However, if the 3.3-V transistors in the level shifting output buffers of the I/O pins are powered prior to the 1.8-V transistors, it is possible for the output buffers to turn on, causing a glitch to occur on the pin during power up. To avoid this behavior, power the  $V_{DD}$  (core voltage) pins prior to or simultaneously with the  $V_{DDIO}$  (input/output voltage) pins, ensuring that the  $V_{DD}$  pins have reached 0.7 V before the  $V_{DDIO}$  pins reach 0.7 V.

There are some requirements on the  $\overline{XRS}$  pin:

- 1. During power up, the  $\overline{XRS}$  pin must be held low for  $t_{w(RSL1)}$  after the input clock is stable (see Table 6-13). This is to enable the entire device to start from a known condition.
- During power down, the XRS pin must be pulled low at least 8 μs prior to V<sub>DD</sub> reaching 1.5 V. This is to enhance flash reliability.

Additionally it is recommended that no voltage larger than a diode drop (0.7 V) should be applied to any pin prior to powering up the device. Voltages applied to pins on an unpowered device can bias internal p-n junctions in unintended ways and produce unpredictable results.

#### 6.8.1 Power Management and Supervisory Circuit Solutions

Table 6-12 lists the power management and supervisory circuit solutions for 280x DSPs. LDO selection depends on the total power consumed in the end application. Go to <a href="http://www.power.ti.com">http://www.power.ti.com</a> for a complete list of TI power ICs.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

www.ti.com

- A. Upon power up, SYSCLKOUT is OSCCLK/2. Since the XCLKOUTDIV bits in the XCLK register come up with a reset state of 0, SYSCLKOUT is further divided by 4 before it appears at XCLKOUT. This explains why XCLKOUT = OSCCLK/8 during this phase.
- B. After reset, the boot ROM code samples Boot Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If boot ROM code executes after power-on conditions (in debugger environment), the boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.
- C. See Section 6.8 for requirements to ensure a high-impedance state for GPIO pins during power-up.

#### Figure 6-8. Power-on Reset

## TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

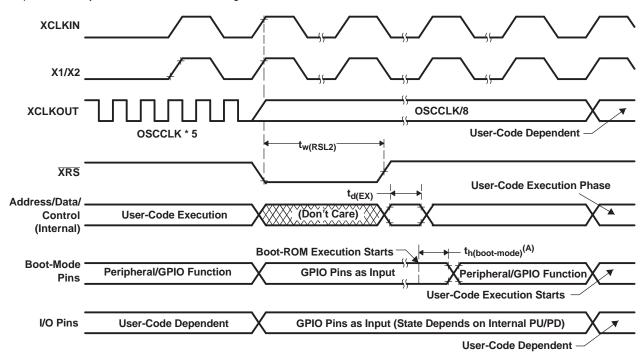

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

## Table 6-13. Reset (XRS) Timing Requirements

|                                   |  |            | MIN                       | NOM                       | MAX | UNIT   |
|-----------------------------------|--|------------|---------------------------|---------------------------|-----|--------|
| t <sub>w(RSL1)</sub> (1)          | Pulse duration, stable XCLKIN to $\overline{XRS}$ high     |            | 8t <sub>c(OSCCLK)</sub>   |                           |     | cycles |
| t <sub>w(RSL2)</sub>              | Pulse duration, XRS low                                    | Warm reset | 8t <sub>c(OSCCLK)</sub>   |                           |     | cycles |
| t <sub>w(WDRS)</sub>              | Pulse duration, reset pulse generated by<br>watchdog       |            |                           | 512t <sub>c(OSCCLK)</sub> |     | cycles |
| t <sub>d(EX)</sub>                | Delay time, address/data valid after $\overline{XRS}$ high |            |                           | 32t <sub>c(OSCCLK)</sub>  |     | cycles |
| t <sub>OSCST</sub> <sup>(2)</sup> | Oscillator start-up time                                   |            | 1                         | 10                        |     | ms     |
| t <sub>h(boot-mode)</sub>         | Hold time for boot-mode pins                               |            | 200t <sub>c(OSCCLK)</sub> |                           |     | cycles |

(1) In addition to the  $t_{w(RSL1)}$  requirement,  $\overline{XRS}$  has to be low at least for 1 ms after V<sub>DD</sub> reaches 1.5 V.

(2) Dependent on crystal/resonator and board design.

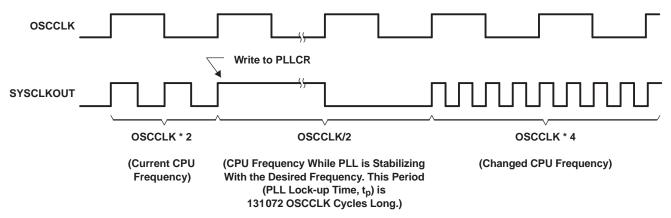

A. After reset, the Boot ROM code samples BOOT Mode pins. Based on the status of the Boot Mode pin, the boot code branches to destination memory or boot code function. If Boot ROM code executes after power-on conditions (in debugger environment), the Boot code execution time is based on the current SYSCLKOUT speed. The SYSCLKOUT will be based on user environment and could be with or without PLL enabled.

Figure 6-9. Warm Reset

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

Figure 6-10 shows an example for the effect of writing into PLLCR register. In the first phase, PLLCR = 0x0004 and SYSCLKOUT = OSCCLK x 2. The PLLCR is then written with 0x0008. Right after the PLLCR register is written, the PLL lock-up phase begins. During this phase, SYSCLKOUT = OSCCLK/2. After the PLL lock-up is complete (which takes 131072 OSCCLK cycles), SYSCLKOUT reflects the new operating frequency, OSCCLK x 4.

## 6.9 General-Purpose Input/Output (GPIO)

## 6.9.1 GPIO - Output Timing

#### Table 6-14. General-Purpose Output Switching Characteristics

|                     | PARAMETER                             |           | MIN MAX | UNIT |
|---------------------|---------------------------------------|-----------|---------|------|
| t <sub>r(GPO)</sub> | Rise time, GPIO switching low to high | All GPIOs | 8       | ns   |
| t <sub>f(GPO)</sub> | Fall time, GPIO switching high to low | All GPIOs | 8       | ns   |
| t <sub>fGPO</sub>   | Toggling frequency, GPO pins          |           | 25      | MHz  |

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

## 6.9.2 GPIO - Input Timing

- A. This glitch will be ignored by the input qualifier. The QUALPRD bit field specifies the qualification sampling period. It can vary from 00 to 0xFF. If QUALPRD = 00, then the sampling period is 1 SYSCLKOUT cycle. For any other value "n", the qualification sampling period in 2n SYSCLKOUT cycles (i.e., at every 2n SYSCLKOUT cycles, the GPIO pin will be sampled).
- B. The qualification period selected via the GPxCTRL register applies to groups of 8 GPIO pins.
- C. The qualification block can take either three or six samples. The GPxQSELn Register selects which sample mode is used.
- D. In the example shown, for the qualifier to detect the change, the input should be stable for 10 SYSCLKOUT cycles or greater. In other words, the inputs should be stable for (5 x QUALPRD x 2) SYSCLKOUT cycles. This would ensure 5 sampling periods for detection to occur. Since external signals are driven asynchronously, an 13-SYSCLKOUT-wide pulse ensures reliable recognition.

#### Figure 6-12. Sampling Mode

|                         |                                 |                      | MIN MAX                                     | UNIT   |
|-------------------------|---------------------------------|----------------------|---|--------|
| t <sub>w(SP)</sub>      | Sampling period                 | QUALPRD = 0          | 1t <sub>c(SCO)</sub>                        | cycles |
|                         |                                 | QUALPRD ≠ 0          | 2t <sub>c(SCO)</sub> * QUALPRD              | cycles |
| t <sub>w(IQSW)</sub>    | Input qualifier sampling window |                      | t <sub>w(SP)</sub> * (n <sup>(1)</sup> – 1) | cycles |
| t (2)                   | Pulse duration, GPIO low/high   | Synchronous mode     | 2t <sub>c(SCO)</sub>                        | cycles |
| t <sub>w(GPI)</sub> (2) |                                 | With input qualifier | $t_{w(IQSW)} + t_{w(SP)} + 1t_{c(SCO)}$     | cycles |

(1) "n" represents the number of qualification samples as defined by GPxQSELn register.

(2) For t<sub>w(GPI)</sub>, pulse width is measured from  $V_{IL}$  to  $V_{IL}$  for an active low signal and  $\overline{V}_{IH}$  to  $V_{IH}$  for an active high signal.

TMS320F2809, TMS320F2808, TMS320F2806 TMS320F2802, TMS320F2801, TMS320C2802 TMS320C2801, TMS320F28016, TMS320F28015

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

## 6.9.3 Sampling Window Width for Input Signals

The following section summarizes the sampling window width for input signals for various input qualifier configurations.

Sampling frequency denotes how often a signal is sampled with respect to SYSCLKOUT.

Sampling frequency = SYSCLKOUT/(2 \* QUALPRD), if QUALPRD ≠ 0 Sampling frequency = SYSCLKOUT, if QUALPRD = 0

Sampling period = SYSCLKOUT cycle x 2 x QUALPRD, if QUALPRD  $\neq$  0

In the above equations, SYSCLKOUT cycle indicates the time period of SYSCLKOUT.

Sampling period = SYSCLKOUT cycle, if QUALPRD = 0

In a given sampling window, either 3 or 6 samples of the input signal are taken to determine the validity of the signal. This is determined by the value written to GPxQSELn register.

#### Case 1:

Qualification using 3 samples

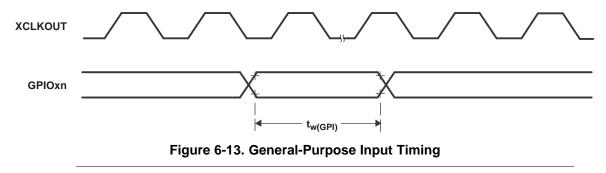

Sampling window width = (SYSCLKOUT cycle x 2 x QUALPRD) x 2, if QUALPRD  $\neq$  0 Sampling window width = (SYSCLKOUT cycle) x 2, if QUALPRD = 0

#### Case 2:

112

Qualification using 6 samples

Sampling window width = (SYSCLKOUT cycle x 2 x QUALPRD) x 5, if QUALPRD  $\neq$  0 Sampling window width = (SYSCLKOUT cycle) x 5, if QUALPRD = 0

#### NOTE

The pulse-width requirement for general-purpose input is applicable for the XINT2\_ADCSOC signal as well.

www.ti.com

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

## 6.9.4 Low-Power Mode Wakeup Timing

Table 6-16 shows the timing requirements, Table 6-17 shows the switching characteristics, and Figure 6-14 shows the timing diagram for IDLE mode.

#### Table 6-16. IDLE Mode Timing Requirements<sup>(1)</sup>

|  | MIN   | NOM | MAX | UNIT   |
|--|---|-----|-----|--------|
| Lt Dude a domethe a contempedation of a set                      | nout input qualifier 2t <sub>c(SCO)</sub>     |     |     | avalaa |
| $t_{w(WAKE-INT)}$ Pulse duration, external wake-up signal With i | n input qualifier $5t_{c(SCO)} + t_{w(IQSW)}$ |     |     | cycles |

(1) This is the time taken to begin execution of the instruction that immediately follows the IDLE instruction. execution of an ISR (triggered by the wake up signal) involves additional latency.

- A. IDLE instruction is executed to put the device into STANDBY mode.
- B. The PLL block responds to the STANDBY signal. SYSCLKOUT is held for approximately 32 cycles (if CLKINDIV = 0) or 64 cycles (if CLKINDIV = 1) before being turned off. This delay enables the CPU pipe and any other pending operations to flush properly.
- C. Clock to the peripherals are turned off. However, the PLL and watchdog are not shut down. The device is now in STANDBY mode.
- D. The external wake-up signal is driven active.
- E. After a latency period, the STANDBY mode is exited.
- F. Normal execution resumes. The device will respond to the interrupt (if enabled).

| t <sub>d(WAKE-HALT)</sub> | <ul> <li>Delay time, PLL lock to program execution resume</li> <li>Wake up from flash <ul> <li>Flash module in sleep state</li> </ul> </li> </ul> |                       | 1125t <sub>c(SCO)</sub> |                              | cycles |
|                           | Wake up from SARAM  |                       |                         | $35t_{c(SCO)}$               | cycles |

- A. IDLE instruction is executed to put the device into HALT mode.
- B. The PLL block responds to the HALT signal. SYSCLKOUT is held for approximately 32 cycles (if CLKINDIV = 0) or 64 cycles (if CLKINDIV = 1) before the oscillator is turned off and the CLKIN to the core is stopped. This delay enables the CPU pipe and any other pending operations to flush properly.
- C. Clocks to the peripherals are turned off and the PLL is shut down. If a quartz crystal or ceramic resonator is used as the clock source, the internal oscillator is shut down as well. The device is now in HALT mode and consumes absolute minimum power.
- D. When the GPIOn pin (used to bring the device out of HALT) is driven low, the oscillator is turned on and the oscillator wake-up sequence is initiated. The GPIO pin should be driven high only after the oscillator has stabilized. This enables the provision of a clean clock signal during the PLL lock sequence. Since the falling edge of the GPIO pin asynchronously begins the wakeup process, care should be taken to maintain a low noise environment prior to entering and during HALT mode.
- E. Once the oscillator has stabilized, the PLL lock sequence is initiated, which takes 131,072 OSCCLK (X1/X2 or X1 or XCLKIN) cycles. Note that these 131,072 clock cycles are applicable even when the PLL is disabled (i.e., code execution will be delayed by this duration even when the PLL is disabled).
- F. Clocks to the core and peripherals are enabled. The HALT mode is now exited. The device will respond to the interrupt (if enabled), after a latency.
- G. Normal operation resumes.

#### 6.10 Enhanced Control Peripherals

#### 6.10.1 Enhanced Pulse Width Modulator (ePWM) Timing

PWM refers to PWM outputs on ePWM1–6. Table 6-22 shows the PWM timing requirements and Table 6-23, switching characteristics.

#### Table 6-22. ePWM Timing Requirements<sup>(1)</sup>

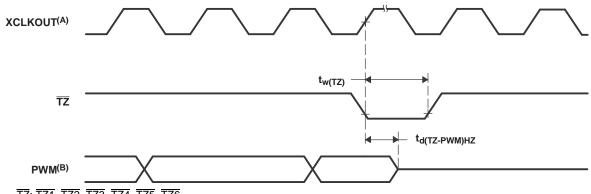

|                       |                        | TEST CONDITIONS      | MIN MAX                     | UNIT   |
|-----------------------|------------------------|----------------------|-----------------------------|--------|
| t <sub>w(SYCIN)</sub> | Sync input pulse width | Asynchronous         | 2t <sub>c(SCO)</sub>        | cycles |
|                       |                        | Synchronous          | 2t <sub>c(SCO)</sub>        | cycles |
|                       |                        | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | cycles |

(1) For an explanation of the input qualifier parameters, see Table 6-15.

#### Table 6-23. ePWM Switching Characteristics

|                          | PARAMETER   | TEST CONDITIONS | MIN                  | MAX | UNIT   |
|--------------------------|---|-----------------|----------------------|-----|--------|
| t <sub>w(PWM)</sub>      | Pulse duration, PWMx output high/low  |                 | 20                   |     | ns     |
| t <sub>w(SYNCOUT)</sub>  | Sync output pulse width   |                 | 8t <sub>c(SCO)</sub> |     | cycles |
| t <sub>d(PWM)tza</sub>   | Delay time, trip input active to PWM forced high<br>Delay time, trip input active to PWM forced low | no pin load     |                      | 25  | ns     |
| t <sub>d(TZ-PWM)HZ</sub> | Delay time, trip input active to PWM Hi-Z   |                 |                      | 20  | ns     |

#### 6.10.2 Trip-Zone Input Timing

 $\mathsf{A}. \quad \overline{\mathsf{TZ}}:\,\overline{\mathsf{TZ1}},\,\overline{\mathsf{TZ2}},\,\overline{\mathsf{TZ3}},\,\overline{\mathsf{TZ4}},\,\overline{\mathsf{TZ5}},\,\overline{\mathsf{TZ6}}$ 

B. PWM refers to all the PWM pins in the device. The state of the PWM pins after TZ is taken high depends on the PWM recovery software.

#### Figure 6-17. PWM Hi-Z Characteristics

#### Table 6-24. Trip-Zone input Timing Requirements<sup>(1)</sup>

|                    |  |                      | MIN MAX                     | UNIT   |
|--------------------|--|----------------------|-----------------------------|--------|
| t <sub>w(TZ)</sub> | Pulse duration, $\overline{TZx}$ input low | Asynchronous         | 1t <sub>c(SCO)</sub>        | cycles |
|                    |  | Synchronous          | 2t <sub>c(SCO)</sub>        | cycles |
|                    |  | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ | cycles |

(1) For an explanation of the input qualifier parameters, see Table 6-15.

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

Table 6-25 shows the high-resolution PWM switching characteristics.

#### Table 6-25. High-Resolution PWM Characteristics at SYSCLKOUT = 60–100 MHz

|   | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| Micro Edge Positioning (MEP) step size <sup>(1)</sup> |     | 150 | 310 | ps   |

(1) Maximum MEP step size is based on worst-case process, maximum temperature and maximum voltage. MEP step size will increase with low voltage and high temperature and decrease with voltage and cold temperature.

Applications that use the HRPWM feature should use MEP Scale Factor Optimizer (SFO) estimation software functions. See the TI software libraries for details of using SFO function in end applications. SFO functions help to estimate the number of MEP steps per SYSCLKOUT period dynamically while the HRPWM is in operation.

Table 6-26 shows the eCAP timing requirement and Table 6-27 shows the eCAP switching characteristics.

#### Table 6-26. Enhanced Capture (eCAP) Timing Requirement<sup>(1)</sup>

|                     |                           | TEST CONDITIONS      | MIN MAX                     | UNIT   |
|---------------------|---------------------------|----------------------|-----------------------------|--------|
| t <sub>w(CAP)</sub> | Capture input pulse width | Asynchronous         | 2t <sub>c(SCO)</sub>        | cycles |
|                     |                           | Synchronous          | 2t <sub>c(SCO)</sub>        |        |
|                     |                           | With input qualifier | $1t_{c(SCO)} + t_{w(IQSW)}$ |        |

(1) For an explanation of the input qualifier parameters, see Table 6-15.

#### Table 6-27. eCAP Switching Characteristics

|                      | PARAMETER                             | TEST CONDITIONS | MIN MAX | UNIT |
|----------------------|---------------------------------------|-----------------|---------|------|
| t <sub>w(APWM)</sub> | Pulse duration, APWMx output high/low |                 | 20      | ns   |

Table 6-28 shows the eQEP timing requirement and Table 6-29 shows the eQEP switching characteristics.

#### Table 6-28. Enhanced Quadrature Encoder Pulse (eQEP) Timing Requirements<sup>(1)</sup>

|                        |                           | TEST CONDITIONS          | MIN MA                         | X UNIT |

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

A. In the master mode, SPISTE goes active 0.5t<sub>c(SPC)</sub> (minimum) before valid SPI clock edge. On the trailing end of the word, the SPISTE will go inactive 0.5t<sub>c(SPC)</sub> after the receiving edge (SPICLK) of the last data bit, except that SPISTE stays active between back-to-back transmit words in both FIFO and non-FIFO modes.

(2) t<sub>c(SPC)</sub> = SPI clock cycle time = LSPCLK/4 or LSPCLK/(SPIBRR + 1)

(3) Internal clock prescalers must be adjusted such that the SPI clock speed is limited to the following SPI clock rate: Master mode transmit 25-MHz MAX, master mode receive 12.5-MHz MAX Slave mode transmit 12.5-MHz MAX, slave mode receive 12.5-MHz MAX.

(4) The active edge of the SPICLK signal referenced is controlled by the CLOCK POLARITY bit (SPICCR.6).

A. In the slave mode, the SPISTE signal should be asserted low at least 0.5t<sub>c(SPC)</sub> before the valid SPI clock edge and remain low for at least 0.5t<sub>c(SPC)</sub> after the receiving edge (SPICLK) of the last data bit.

| ENOB (100 kHz) Effective number of bits  |                                   |       | 10.9  |      | Bits   |
| SFDR (100 kHz) Spurious free dynamic range   |                                   |       | 83    |      | dB     |

(1) Tested at 12.5 MHz ADCCLK.

(2) All voltages listed in this table are with respect to V<sub>SSA2</sub>.

(3) TI specifies that the ADC will have no missing codes.

(4) 1 LSB has the weighted value of 3.0/4096 = 0.732 mV.

(5) A single internal/external band gap reference sources both ADCREFP and ADCREFM signals, and hence, these voltages track together. The ADC converter uses the difference between these two as its reference. The total gain error listed for the internal reference is inclusive of the movement of the internal bandgap over temperature. Gain error over temperature for the external reference option will depend on the temperature profile of the source used.

(6) Voltages above V<sub>DDA</sub> + 0.3 V or below V<sub>SS</sub> - 0.3 V applied to an analog input pin may temporarily affect the conversion of another pin. To avoid this, the analog inputs should be kept within these limits.

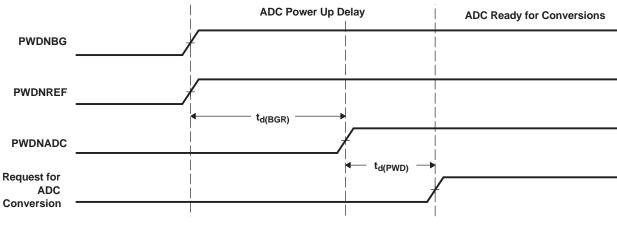

(7) TI recommends using high precision external reference TI part REF3020/3120 or equivalent for 2.048-V reference.

Typical Values of the Input Circuit Components:

#### Figure 6-25. ADC Analog Input Impedance Model

#### 6.10.7.2 Definitions

#### **Reference Voltage**

The on-chip ADC has a built-in reference, which provides the reference voltages for the ADC.

#### **Analog Inputs**

The on-chip ADC consists of 16 analog inputs, which are sampled either one at a time or two channels at a time. These inputs are software-selectable.

#### Converter

The on-chip ADC uses a 12-bit four-stage pipeline architecture, which achieves a high sample rate with low power consumption.

#### **Conversion Modes**

The conversion can be performed in two different conversion modes:

- Sequential sampling mode (SMODE = 0)
- Simultaneous sampling mode (SMODE = 1)

#### 6.10.7.3 Sequential Sampling Mode (Single-Channel) (SMODE = 0)

In sequential sampling mode, the ADC can continuously convert input signals on any of the channels (Ax to Bx). The ADC can start conversions on event triggers from the ePWM, software trigger, or from an external ADCSOC signal. If the SMODE bit is 0, the ADC will do conversions on the selected channel on every Sample/Hold pulse. The conversion time and latency of the Result register update are explained below. The ADC interrupt flags are set a few SYSCLKOUT cycles after the Result register update. The selected channels will be sampled at every falling edge of the Sample/Hold pulse. The Sample/Hold pulse width can be programmed to be 1 ADC clock wide (minimum) or 16 ADC clocks wide (maximum).

6.10.7.4 Simultaneous Sampling Mode (Dual-Channel) (SMODE = 1)

In simultaneous mode, the ADC can continuously convert input signals on any one pair of channels (A0/B0 to A7/B7). The ADC can start conversions on event triggers from the ePWM, software trigger, or from an external ADCSOC signal. If the SMODE bit is 1, the ADC will do conversions on two selected channels on every Sample/Hold pulse. The conversion time and latency of the result register update are explained below. The ADC interrupt flags are set a few SYSCLKOUT cycles after the Result register update. The selected channels will be sampled simultaneously at the falling edge of the Sample/Hold pulse. The Sample/Hold pulse width can be programmed to be 1 ADC clock wide (minimum) or 16 ADC clocks wide (maximum).

#### 6.11 Detailed Descriptions

#### **Integral Nonlinearity**

Integral nonlinearity refers to the deviation of each individual code from a line drawn from zero through full scale. The point used as zero occurs one-half LSB before the first code transition. The full-scale point is defined as level one-half LSB beyond the last code transition. The deviation is measured from the center of each particular code to the true straight line between these two points.

#### **Differential Nonlinearity**

An ideal ADC exhibits code transitions that are exactly 1 LSB apart. DNL is the deviation from this ideal value. A differential nonlinearity error of less than ±1 LSB ensures no missing codes.

#### Zero Offset

The major carry transition should occur when the analog input is at zero volts. Zero error is defined as the deviation of the actual transition from that point.

#### Gain Error

The first code transition should occur at an analog value one-half LSB above negative full scale. The last transition should occur at an analog value one and one-half LSB below the nominal full scale. Gain error is the deviation of the actual difference between first and last code transitions and the ideal difference between first and last code transitions.

#### Signal-to-Noise Ratio + Distortion (SINAD)

SINAD is the ratio of the rms value of the measured input signal to the rms sum of all other spectral components below the Nyquist frequency, including harmonics but excluding dc. The value for SINAD is expressed in decibels.

#### Effective Number of Bits (ENOB)

For a sine wave, SINAD can be expressed in terms of the number of bits. Using the following formula,  $N = \frac{(SINAD - 1.76)}{(SINAD - 1.76)}$ 

 $\frac{1}{6.02}$  it is possible to get a measure of performance expressed as N, the effective number of bits. Thus, effective number of bits for a device for sine wave inputs at a given input frequency can be calculated directly from its measured SINAD.

#### Total Harmonic Distortion (THD)

THD is the ratio of the rms sum of the first nine harmonic components to the rms value of the measured input signal and is expressed as a percentage or in decibels.

#### Spurious Free Dynamic Range (SFDR)

SFDR is the difference in dB between the rms amplitude of the input signal and the peak spurious signal.

| Erase Time           | 8K Sector   |                 | 2   |  | s    |
|                      | 4K Sector   |                 | 2   |  | s    |
| I <sub>DD3VFLP</sub> | V <sub>DD3VFL</sub> current consumption during the                  | Erase           | 75  |  | mA   |
|                      | Erase/Program cycle   | Program         | 500<br>250<br>125<br>2<br>2<br>2<br>2<br>2<br>2 |  | mA   |
| I <sub>DDP</sub>     | V <sub>DD</sub> current consumption during<br>Erase/Program cycle   |                 | 140   |  | mA   |
| IDDIOP               | V <sub>DDIO</sub> current consumption during<br>Erase/Program cycle |                 | 20  |  | mA   |

(1) Typical parameters as seen at room temperature including function call overhead, with all peripherals off.

#### Table 6-46. Flash/OTP Access Timing

|                     | PARAMETER                | MIN | TYP | MAX | UNIT |
|---------------------|--------------------------|-----|-----|-----|------|
| t <sub>a(fp)</sub>  | Paged flash access time  | 36  |     |     | ns   |
| t <sub>a(fr)</sub>  | Random flash access time | 36  |     |     | ns   |
| t <sub>a(OTP)</sub> | OTP access time          | 60  |     |     | ns   |

Equations to compute the Flash page wait-state and random wait-state in Table 6-47 are as follows:

Flash Page Wait-State = 
$$\left[ \left( \frac{t_{a(fp)}}{t_{c(SCO)}} \right) - 1 \right]$$
 (round up to the next highest integer) or 0, whichever is larger  
Flash Random Wait-State =  $\left[ \left( \frac{t_{a(fr)}}{t_{c(SCO)}} \right) - 1 \right]$  (round up to the next highest integer) or 1, whichever is larger

Equation to compute the OTP wait-state in Table 6-47 is as follows:

OTP Wait-State = 
$$\left[\left(\frac{t_{a(OTP)}}{t_{c(SCO)}}\right) - 1\right]$$
 (round up to the next highest integer) or 1, whichever is larger

#### Table 6-47. Minimum Required Flash/OTP Wait-States at Different Frequencies

| SYSCLKOUT<br>(MHz) | SYSCLKOUT (ns) | FLASH PAGE<br>WAIT-STATE | FLASH RANDOM<br>WAIT-STATE <sup>(1)</sup> | OTP WAIT-STATE |
|--------------------|----------------|--------------------------|---|----------------|
| 100                | 10             | 3                        | 3   | 5              |
| 75                 | 13.33          | 2                        | 2   | 4              |
| 60                 | 16.67          | 2                        | 2   | 3              |
| 50                 | 20             | 1                        | 1   | 2              |
| 30                 | 33.33          | 1                        | 1   | 1              |
| 25                 | 40             | 0                        | 1   | 1              |
| 15                 | 66.67          | 0                        | 1   | 1              |
| 4                  | 250            | 0                        | 1   | 1              |

(1) Random wait-state must be greater than or equal to 1.

## 6.13 ROM Timing (C280x only)

#### Table 6-48. ROM/OTP Access Timing

|                     | PARAMETER                                 | MIN | ТҮР | MAX | UNIT |
|---------------------|---|-----|-----|-----|------|
| t <sub>a(rp)</sub>  | Paged ROM access time                     | 19  |     |     | ns   |
| t <sub>a(rr)</sub>  | Random ROM access time                    | 19  |     |     | ns   |
| t <sub>a(ROM)</sub> | ROM (OTP area) access time <sup>(1)</sup> | 60  |     |     | ns   |

(1) In C280x devices, a 1K X 16 ROM block replaces the OTP block found in Flash devices.

Equations to compute the page wait-state and random wait-state in Table 6-49 are as follows:

ROM Page Wait-State = 
$$\left[ \left( \frac{t_{a(rp)}}{t_{c(SCO)}} \right) - 1 \right]$$
 (round up to the next highest integer) or 0, whichever is larger  
ROM Random Wait-State =  $\left[ \left( \frac{t_{a(rr)}}{t_{c(SCO)}} \right) - 1 \right]$  (round up to the next highest integer) or 1, whichever is larger

# Table 6-49. ROM/ROM (OTP area) Minimum Required Wait-States at Different Frequencies

| SYSCLKOUT<br>(MHz) | SYSCLKOUT<br>(ns) | PAGE<br>WAIT-STATE | RANDOM<br>WAIT-STATE <sup>(1)</sup> |
|--------------------|-------------------|--------------------|-------------------------------------|
| 100                | 10                | 1                  | 1                                   |
| 75                 | 13.33             | 1                  | 1                                   |
| 50                 | 20                | 0                  | 1                                   |
| 30                 | 33.33             | 0                  | 1                                   |
| 25                 | 40                | 0                  | 1                                   |
| 15                 | 66.67             | 0                  | 1                                   |
| 4                  | 250               | 0                  | 1                                   |

(1) Random wait-state must be greater than or equal to 1.

#### 7 Migrating From F280x Devices to C280x Devices

#### 7.1 **Migration Issues**

The migration issues to be considered while migrating from the F280x devices to C280x devices are as follows:

- The 1K OTP memory available in F280x devices has been replaced by 1K ROM C280x devices.
- Current consumption differs for F280x and C280x devices for all four possible modes. See the • appropriate electrical section for exact numbers.
- The V<sub>DD3VEI</sub> pin is the 3.3-V Flash core power pin in F280x devices but is a V<sub>DDI0</sub> pin in C280x devices.
- F280x and C280x devices are pin-compatible and code-compatible; however, they are electrically different with different EMI/ESD profiles. Before ramping production with C280x devices, evaluate performance of the hardware design with both devices.
- Addresses 0x3D 7BFC through 0x3D 7BFF in the OTP and addresses 0x3F 7FF0 through 0x3F 7FF5 in the main ROM array are reserved for ROM part-specific information and are not available for user applications.
- The paged and random wait-state specifications for the Flash and ROM parts are different. While migrating from Flash to ROM parts, the same wait-state values must be used for best-performance compatibility (for example, in applications that use software delay loops or where precise interrupt latencies are critical).
- The analog input switch resistance is smaller in C280x devices compared to F280x devices. While migrating from a Flash to a ROM device care should be taken to design the analog input circuits to meet the application performance required by the sampling network.
- The PART-ID register value is different for Flash and ROM parts. ٠
- From a silicon functionality/errata standpoint, rev A ROM devices are equivalent to rev C flash devices. See the errata applicable to 280x devices for details.
- As part of the ROM code generation process, all unused memory locations in the customer application are automatically filled with 0xFFFF. Unused locations should not be manually filled with any other data.

For errata applicable to 280x devices, see the TMS320F280x, TMS320C280x, and TMS320F2801x DSC Silicon Errata (literature number SPRZ171).

## 8 Revision History

This data sheet revision history highlights the technical changes made to the SPRS230L device-specific data sheet to make it an SPRS230M revision.

#### Scope: See table below.

| LOCATION    | ADDITIONS, DELETIONS, AND MODIFICATIONS  |  |  |  |  |  |
|-------------|--|--|--|--|--|--|
| Table 2-3   | Signal Descriptions:   |  |  |  |  |  |
|             | Updated DESCRIPTION of ADCREFP:  |  |  |  |  |  |
|             | <ul> <li>Changed "Requires a low ESR (50 mΩ–1.5 Ω) ceramic bypass capacitor" to "Requires a low ESR (under 1.5 Ω) ceramic bypass capacitor"</li> </ul> |  |  |  |  |  |
|             | <ul> <li>Added NOTE about using the ADC Clock rate to derive the ESR specification</li> </ul>  |  |  |  |  |  |
|             | Updated DESCRIPTION of ADCREFM:  |  |  |  |  |  |
|             | <ul> <li>Changed "Requires a low ESR (50 mΩ–1.5 Ω) ceramic bypass capacitor" to "Requires a low ESR (under 1.5 Ω) ceramic bypass capacitor"</li> </ul> |  |  |  |  |  |
|             | <ul> <li>Added NOTE about using the ADC Clock rate to derive the ESR specification</li> </ul>  |  |  |  |  |  |
| Section 4.6 | Updated "Enhanced Analog-to-Digital Converter (ADC) Module" section  |  |  |  |  |  |
| Section 5.3 | Added "Community Resources" section  |  |  |  |  |  |
| Table 6-43  | Flash Endurance for A and S Temperature Material:  |  |  |  |  |  |
|             | Added "ERASE/PROGRAM TEMPERATURE" column heading   |  |  |  |  |  |
| Table 6-44  | Flash Endurance for Q Temperature Material:  |  |  |  |  |  |
|             | Added "ERASE/PROGRAM TEMPERATURE" column heading   |  |  |  |  |  |
| Table 6-45  | Flash Parameters at 100-MHz SYSCLKOUT:   |  |  |  |  |  |
|             | Erase Time:  |  |  |  |  |  |
|             | <ul> <li>Changed TYP value of 16K Sector from 10 s to 2 s</li> </ul>   |  |  |  |  |  |
|             | <ul> <li>Changed TYP value of 8K Sector from 10 s to 2 s</li> </ul>  |  |  |  |  |  |
|             | <ul> <li>Changed TYP value of 4K Sector from 10 s to 2 s</li> </ul>  |  |  |  |  |  |

SPRS230M-OCTOBER 2003-REVISED MARCH 2011

## 9 Mechanical Data

Table 9-1 through Table 9-6 show the thermal data.

The mechanical package diagram(s) that follow the table(s) reflect the most current released mechanical data available for the designated device(s).

#### Table 9-1. F280x Thermal Model 100-pin GGM Results

| AIR FLOW                          |        |         |         |         |  |  |  |

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

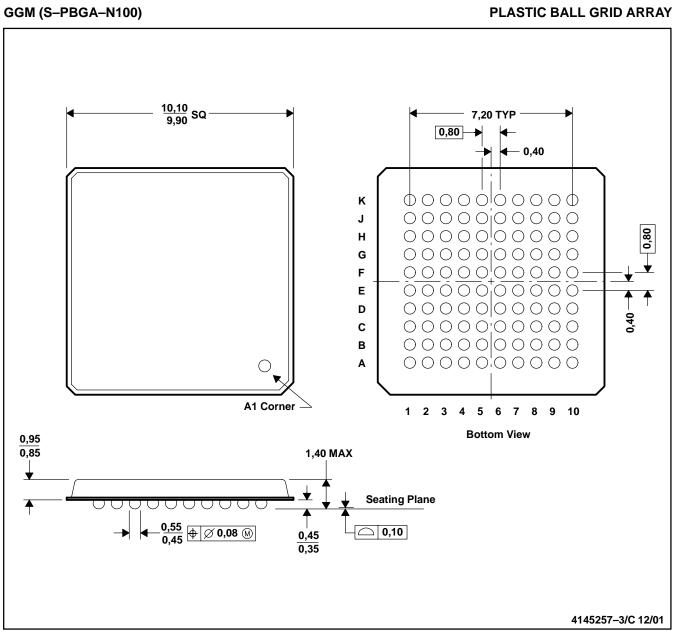

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

#### **IMPORTANT NOTICE**

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
